JOB PERFORMANCE REPORT

RESEARCH PROJECT SEGMENT  
(Inventory)

State: U T A H Grant Title: Statewide Wildlife Management Inventory

Project No.: W-65-R Segment No.: 41

Job Title: Statewide Upland Game  
Job No.: A-4

Period Covered: October 1, 1992 to September 30, 1993

Abstract: This report includes upland game inventory and harvest data collected during 1992-93. Results of annual inventory and harvest surveys and long-term trends of indices derived by each method are included in the final report. Data obtained in 1993 are compared to 1992 and long-term averages.

Objectives:

1. Conduct efficient breeding and production surveys.
2. Determine annual harvest, hunters, hunter-days and success rates.
3. Inventory critical seasonal habitat.

Procedures:

Annual inventory procedures for ring-necked pheasants included winter sex ratio counts and summer roadside counts. The winter sex ratio counts were conducted from December 15, 1992 through February 10, 1993, as snow cover conditions allowed. Indices derived include hen-cock ratios and pheasants observed per 100 hours. Annual summer roadside counts (three or more per route) were conducted from July 22-August 22 on permanently established routes. Indices derived include pheasants per mile, young per mile, young per hen, mean brood and percent of hens with young.

Mourning dove breeding population trend was determined via the annual call count survey. This survey is part of a nationwide survey administered by the U. S. Fish and Wildlife Service. Call counts are conducted over 15 permanent, 20-mile routes. One count was made on each route between May 20-30.

Random brood counts were conducted on chukar and gray partridge, forest grouse (ruffed and blue), sage grouse, sharp-tailed grouse, wild turkey and quail from June 15-August 22. Indices derived for each species include mean brood size, young per 100 adults and birds observed per 100 hours of effort.

Sage grouse strutting ground counts and sharp-tailed grouse dancing ground counts were conducted from March 15-May 15. Total cocks counted, average cocks per ground and percent change from 1992 for comparable grounds were determined on a county basis.

Gambel's quail long-period waterhole counts were completed in July and August. Limited California quail random brood counts were made in several counties.

Cottontail rabbit roadside counts were conducted over pre-established routes between July 15 and August 22. Indices derived include rabbits per mile and young per 100 adults.

Harvest questionnaires were mailed to determine the harvest of upland game birds, cottontail rabbit, and snowshoe hare. A sample of eligible licensees from the current year's (1993) resident small game license file and 1993 combination license file was used. The modified computerized pull-apart mailer was again used to obtain harvest data. Separate questionnaires were mailed to all band-tailed pigeon, white-tailed ptarmigan and wild turkey permittees. Indices derived include total hunters, hunter-days, total harvest and hunter success per day, plus success for each season.

The upland game questionnaires were processed by the Division of Wildlife Resources Wildlife Management Services Section. General upland game questionnaires as well as band-tailed pigeon, wild turkey and white-tailed ptarmigan questionnaires were analyzed by Wildlife Section personnel.

Upland game hunters were checked at checking stations, and random field bag checks were made during each hunting season. Indices derived include bag per hunter (per day), bag per 100 hours, average hours per hunter-day and average hours per bird bagged. Additional sex and age composition data were compiled for some species using wing samples collected at checking stations.

**Recommendations:** This project should be continued for the purpose of determining trends of upland game populations and harvest statistics in Utah.

# INTRODUCTION

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high death rates, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend and harvest of each upland game population.

This is the twenty-third edition of this Annual Upland Game Report. It is an annual performance report of information compiled during inventory and harvest surveys conducted under Federal Aid Project W-65-R, Job A-4. Information contained herein was compiled by conservation officers, biologists, wildlife managers and the upland game management staff of the Utah Division of Wildlife Resources.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game. A separate section is devoted to each species of upland game in Utah. Data are presented primarily in tabular form with limited narrative comment. The first page of each section provides a brief summary of population status and trend as indicated by inventory and harvest data.

During 1993, a total of 59,590 Utah sportsmen spent 402,968 days afield in pursuit of various upland game species (Table 1). The harvest of upland game totaled 362,611 animals. The proportion of the total upland game hunters which pursued each species is shown in Table 2 and the percentage failing to bag at least one bird (from general mail questionnaire) of each species in Table 3.

In 1993, Utah upland game hunters were again required to purchase an Upland Game Habitat Stamp in order to pursue pheasants, mourning doves, chukar partridge, sage grouse, forest grouse, quail, Hungarian partridge, cottontail rabbit and snowshoe hare. Funds derived from the Upland Game Habitat Stamp will be used to purchase, develop and protect critical upland game habitat throughout Utah.

The regulations for 1993 upland game hunting seasons are shown in Appendix D.

GENERAL HARVEST QUESTIONNAIRE

Harvest statistics were obtained from a random sample of licensed hunters by their response to a hunter questionnaire. The combined upland game bird and rabbit-hare questionnaire was again used.

A total of 16,534 upland game questionnaires, a 16.00 percent sample, were mailed. Of the total, 851 (5.15%) questionnaires were undeliverable. Of the 15,683 questionnaires delivered, 5,442 (34.70%) useable upland game questionnaires were returned. Of those, 2,318 purchased a license but did not hunt upland game. By dividing the total of 103,413 eligible licensees by the usable returns (5,442), a projection factor of 19.002756 is derived.

The 1993 hunter questionnaire sample size increased from 1992, so a follow-up questionnaire was not sent to those who failed to return the first one. A high rate of return is desirable in order to obtain an adequate sample of harvest estimates in counties where hunting pressure and harvest are limited. Extremely small samples from these counties tend to over-estimate the harvest and thus bias the results. Although harvest, number of hunters and days-afield may be over-estimated where small samples are obtained, harvest per hunter-day should be relatively precise.

**Table 1. Summary of harvest statistics from the general mail questionnaire for 1993.**

Species	Hunters Afield	Total Harvest	Hunter-Days	Bag Per Hunter-Day	Bag Per Hunter	Bag Per Hunter For Season

\*Although wild turkey, sharp-tailed grouse, band-tailed pigeon and white-tailed ptarmigan harvest was determined by separate questionnaires, it is assumed that these hunters are derived from the same group of hunters who reported hunting other upland game bird species.

\*\*This is not the total of the columns because many upland game hunters hunted more than one species.

The upland game questionnaire is designed to monitor statewide harvest trend from year to year. The more extensively a species is hunted, the more accurately the questionnaire measures the trend data. In an effort to improve the accuracy of indices for species which receive very little hunting pressure and harvest, and which have low densities and limited distribution, a unique questionnaire for that species is mailed to the permit holder. This method has been used for band-tailed pigeon, wild turkey, sharp-tailed grouse and white-tailed ptarmigan.

The annual harvest report is sometimes criticized for being inaccurate and without value. However, report users must recognize that the accuracy of the questionnaire is based on some basic assumptions. These assumptions are: (1) the returned useable sample is a completely random sample, (2) respondents recorded data correctly, i.e., they clearly understood the questionnaire, (3) respondents recorded data accurately, did not guess or lie, and (4) respondents correctly identified species hunted. If these assumptions are not met, projections of harvest by county may be over-estimated due to nonrespondent or memory biases. Extreme caution should be used in the interpretation of estimated harvest and hunters for specific species in specific counties. Rather, the long-term trend in these indices should be used in managing the populations.

Presently, the Upland Game Annual Report contains the best data available and therefore constitutes the basic facts of upland game management. Although this report has its limitations, the trend data is valuable in making professional judgments regarding upland game populations and harvest.

The annual report is used in wildlife planning. It can be used to establish relative importance among species and for developing new resources through transplants or habitat developments. It points out areas of needed research by indicating problems and possible causes. It documents population trends and it combines all this inventory information into one easily accessible publication. Thus it is used extensively by federal land management agencies in environmental impact statements and management plans. It will become increasingly more important in developing management plans and assessing impacts on wildlife habitat.

# RING-NECKED PHEASANT

## SUMMARY

The 1992-93 winter was severe with below normal temperatures (November-February) and extreme snowpack (November-March). Because the most limiting factor for pheasants in Utah is significant winter cover adjacent to winter food sources, survival of pheasant brood stock was marginal.

Weather conditions during the nesting season were unfavorable in 1993. Statewide monthly average temperatures were at or below normal (May-July). Average precipitation was above normal across several climatic subdivisions (May-June). Pheasants observed on roadside routes was below 1992, but hens appeared to have more young.

Harvest statistics compiled from the questionnaire indicated a decrease in success compared to 1992. Harvest decreased 24 percent from 1992, and remained 70 percent below the long-term average. Opening weekend success was down compared to the previous year based upon field bag check data.

Utah's pheasant population continues to decline steadily due to losses of critical habitat and degradation of remaining habitat. In 1992, the Utah legislature authorized an Upland Game Habitat Stamp. Seventy-two percent of the funds generated by the stamp are to be used on pheasant habitat projects.

### Winter Sex Ratio Counts

Results of the survey for the winter of 1992-93 and long-term trends are shown in Tables 1, 2 and Figure 1 of this section. Statewide comparisons to the winter of 1991-92 and the 10-year (1983-92) average are as follows:

	<u>Winter of 1992-93</u>	<u>Percent change from 1991-92</u>	<u>Average</u>
Total pheasants counted (roadside)	508	-43	-76
Hens per cock	2.28	+6	-31
Pheasants observed per 100 hours	1,864	+44	+47
Total hours effort (roadside)	27	-64	-83

Winter sex ratio counts indicated a 44 percent increase in pheasants observed per unit of effort. However, density estimates can be biased due to the non-random nature of the survey technique if effort is minimal as in 1993. The hen-cock ratio increased 6 percent from 1992, but was 31 percent below the long-term average. Effort to collect winter sex ratio data decreased 64 percent from 1992. No effort was expended in the Southeastern Region.

### Roadside Counts

A summary of summer roadside pheasant counts for 1993 is shown in Table 3. Long-term trends of pheasants per mile, young per mile, young per hen, percent of hens with young and mean brood size are found in Tables 4-8 and Figure 2. Summer 1993 survey results compared to 1992 and the previous 10-year (1983-92) average follow:

	<u>1993</u>	<u>Percent change from 1992</u>	<u>Average</u>
Total pheasants observed	523	-57	-68
Total miles driven	1,306	-19	-31
Pheasants per mile	0.40	-47	-52
Average brood size	5.81	+48	+17
Young per hen	4.31	+27	+12
Percent of hens with young	85	0	+12

Total pheasants observed decreased 57 percent and pheasants per mile decreased 47 percent. Percent of hens with young remained the same while average brood size increased 48 percent.

## Harvest

### Hunter Questionnaire

Results of the hunter questionnaire for 1993 are shown in Table 9. Long-term trends of pheasants bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 10-12, and total statewide harvest statistics in Table 13. A comparison of 1993 harvest statistics to 1992 and the previous 45-year average follow:

	<u>1993</u>	<u>Percent change from 1992</u>	<u>Average</u>
Pheasant hunters	39,640	-5	-49
Pheasants harvested	63,336	-26	-70
Hunter-days afield	141,399	-6	-34
Pheasants per hunter-day	0.45	-21	-52
Pheasants per hunter	1.60	-22	-39

Total hunters decreased (5 percent) from 1992 and remained 49 percent below the long-term (1948-92) average. Total harvest decreased 29 percent from 1992. Hunter success (pheasants per hunter-day) decreased 21 percent from 1992. Pheasants per hunter decreased (22 percent) and remains 39 percent below the long-term average.

Long-term trends (1948-93) of total hunters, hunter-days, harvest and hunter success are shown in Figures 3 and 4. Generally, the recent trend is toward less hunter-days with declines in total pheasants harvested and hunter success. We believe this is the result of the accumulated effects of loss of quantity and quality of habitat due to urbanization, flooding, modern agricultural practices, and habitat fragmentation resulting in increased predation.

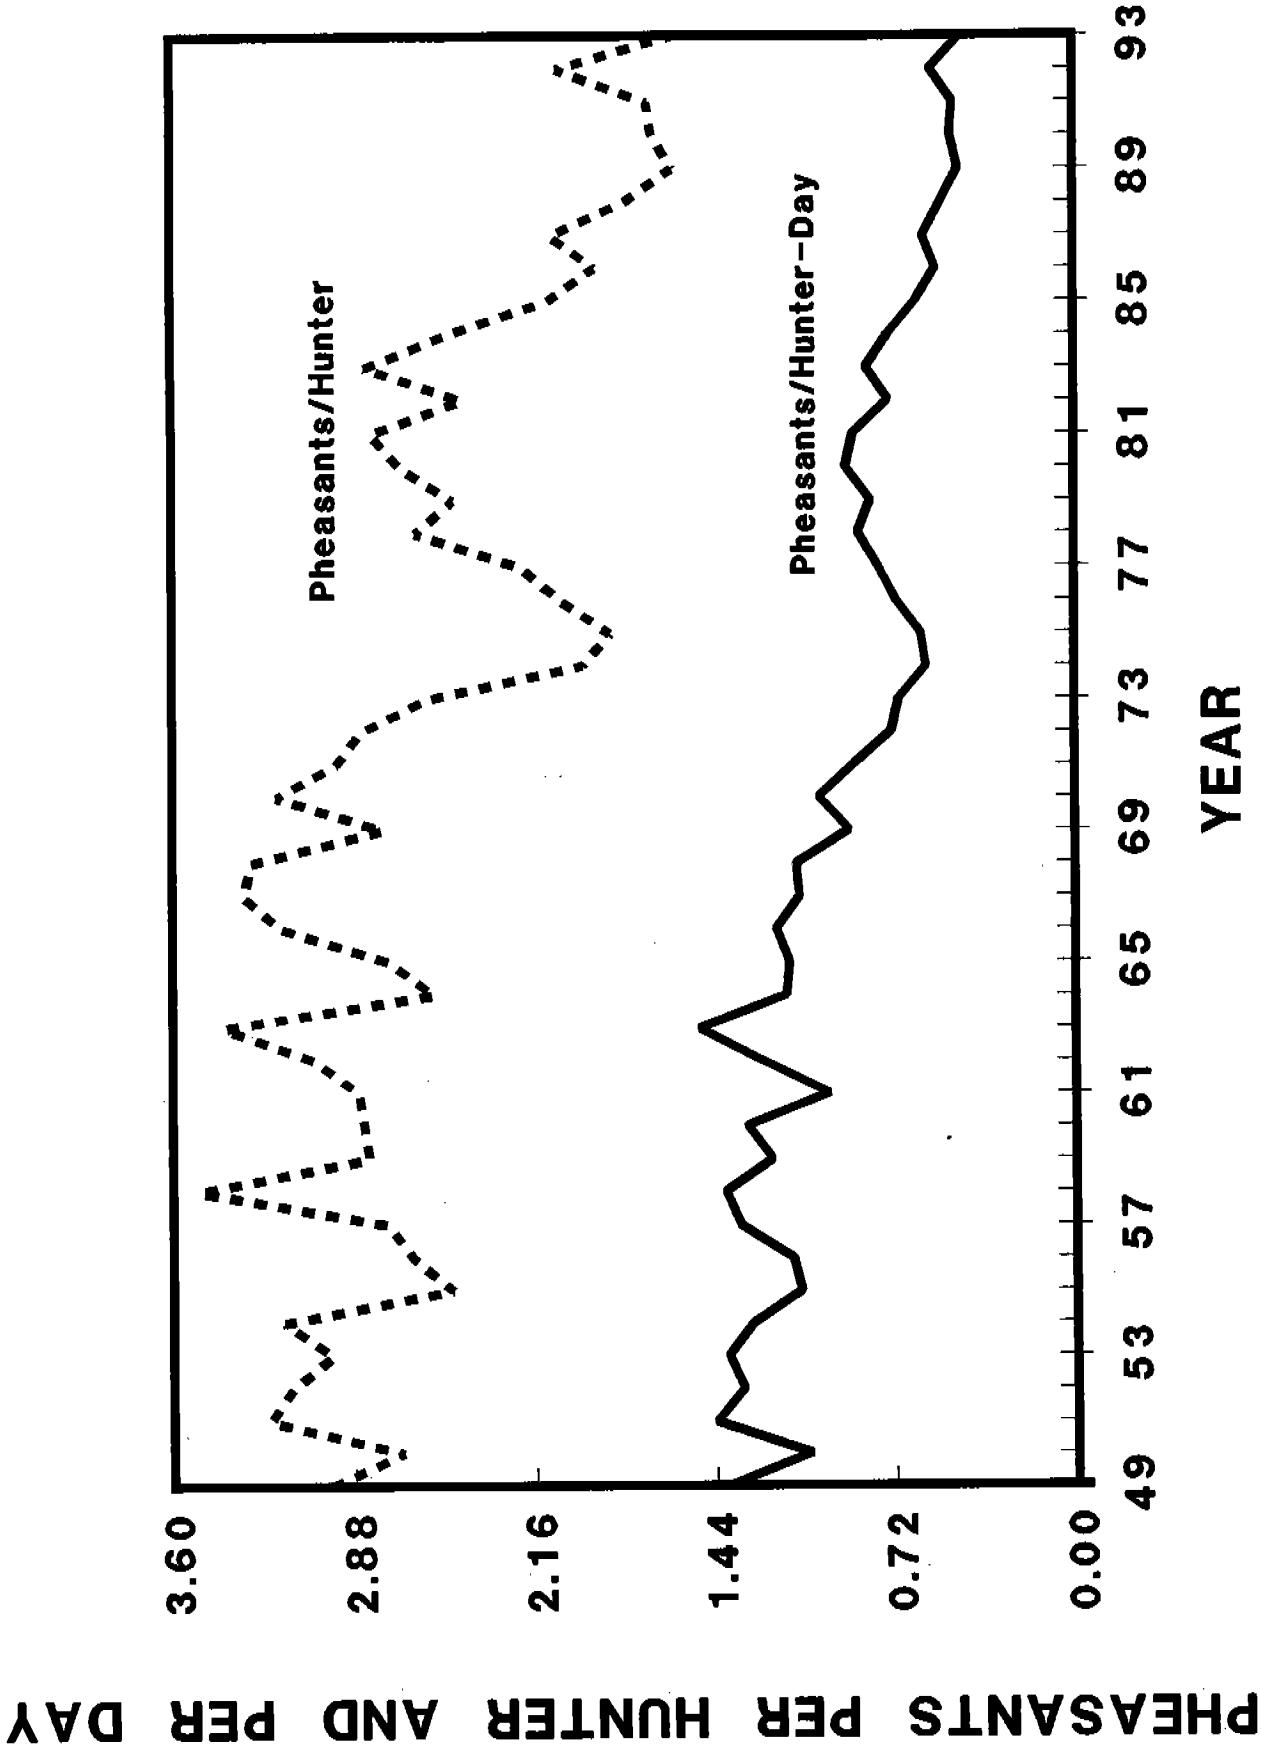

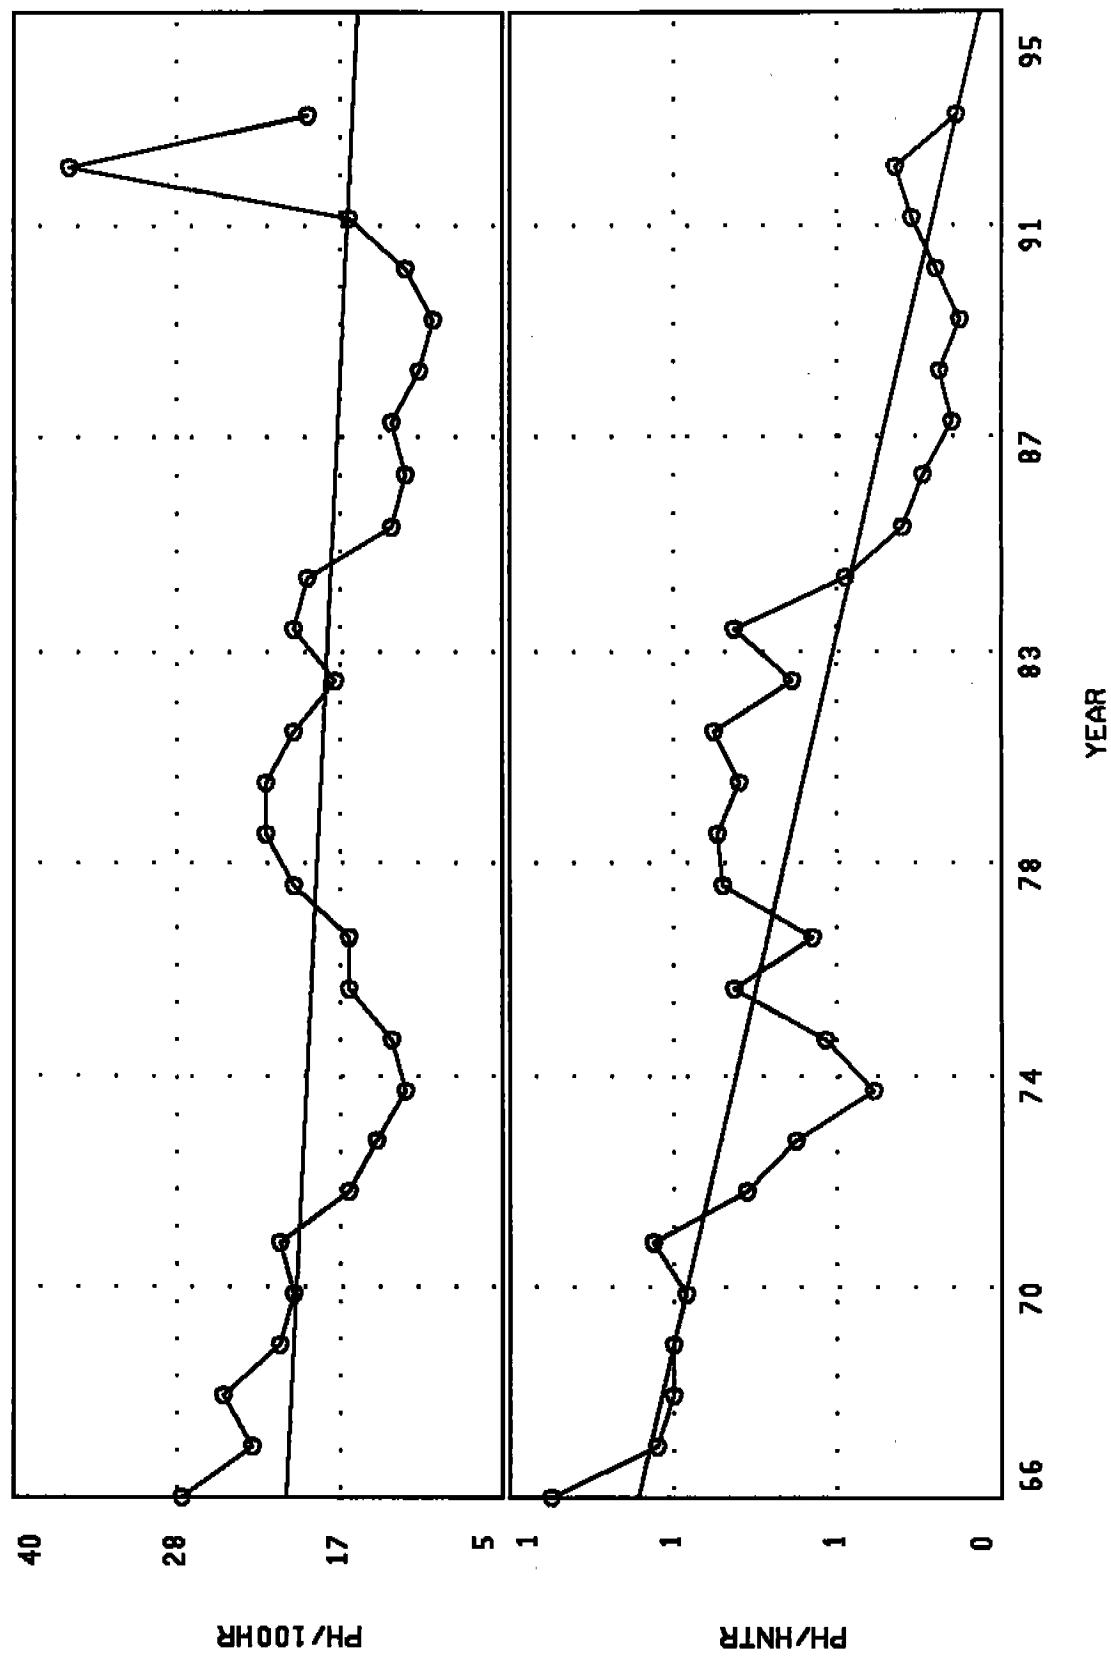

Figure 4. Statewide trends of pheasant hunter success rates, 1949-93.

FIGURES. PHEASANT FIELD BAG CHECK  
INDICES, 1966-93.

#### Field Bag Checks

A summary of pheasant field bag check data for 1993 is shown in Table 14. The hunter success trend determined via bag checks since 1988 is found in Table 15 and Figure 5. A comparison of 1993 data, on a statewide basis, to 1992 and the previous 10-year (1983-92) average follow:

		<u>Percent change from</u>	
	<u>1993</u>	<u>1992</u>	<u>Average</u>
Total hunters checked	417	-5	-83
Total hours hunted	698	+25	-90
Pheasants per hunter (complete hunts)	0.31	-33	-31
Pheasants bagged per 100 hours	19	-47	+18
Average hours per hunter-day (complete hunts)	1.67	+31	-44
Hours hunted per pheasant bagged (complete hunts)	5.37	+95	-24

Hunting pressure was down slightly in most of Utah. This is attributed to decreasing pheasant populations and to less land being accessible to hunters.

In 1992, hunters spent 31 percent more time afield on an average day. Hours hunted per pheasant bagged increased 95 percent.

# MIGRATORY UPLAND GAME BIRDS

## SUMMARY

### Mourning Doves

The breeding density index increased slightly in 1993, but remained 6 percent below average.

Harvest statistics derived from the questionnaire indicated an increase in number of hunters and harvest compared to 1992. However, hunter success for the season increased slightly.

Field bag checks indicated a significant increase in hunter success on opening day. Hunters who participated hunted less hours than the previous year, and spent more time afield per dove harvested.

Aging of wings indicated the juvenile per 100 adult ratio decreased to 86 compared to 92 in 1992. Juvenile per 100 adult ratio remains 25 percent below the long-term average.

### Band-tailed Pigeons

A band-tailed pigeon hunting permit was required again in 1993 to obtain mailing addresses for a questionnaire. Thirteen hunters purchased permits and 3 went afield. No pigeons were harvested.

## MOURNING DOVE

### Call Count Survey

Results of the 1993 call count survey are found in Table 1 of this section. The long-term trend of the state's breeding density index (average doves heard per route) is shown in Table 2. Indices shown in each of these tables are unweighted and consequently differ from those published in the annual Mourning Dove Status Report compiled by the U.S. Fish and Wildlife Service. However, indicated trends are similar (Figure 1). The following is a comparison of the results of the 1993 survey compared to 1992 and the average for the period 1964-1992:

		<u>Percent change from</u>	
	<u>1993</u>	<u>1992</u>	<u>Average</u>
Average doves heard per route	11.67	+27	-6
Average doves seen per route	9.07	+64	-35

Coo count data indicated slightly increased breeding activity in late May compared to 1992, and was only 6 percent below the long-term average of doves heard per route.

### Harvest

#### Hunter Questionnaire

Information obtained from the hunter questionnaire for 1993 is summarized in Table 3. Long-term trends of mourning doves bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 4-6 and total statewide harvest statistics in Table 7 and Figures 2 and 3. The following is a comparison of the harvest statistics for 1993 compared to 1992 and the previous 42-year average:

		<u>Percent change from</u>	
	<u>1993</u>	<u>1992</u>	<u>Average</u>
Mourning dove hunters	19,725	+9	-11
Mourning doves harvested	170,834	+6	-17
Hunter-days afield	68,143	-1	-1
Mourning doves per hunter-day	2.51	+7	-24
Mourning doves per hunter	8.66	-4	-4

Hunter success increased slightly from 1992. Total harvest increased 6 percent compared to 1992. Numbers of dove hunters increased 9 percent and hunter-days afield decreased slightly. Doves per hunter-day and doves per hunter increased 7 percent from 1992.

Long-term harvest trends are depicted in Figure 2.

## AVERAGE DOVES HEARD PER ROUTE

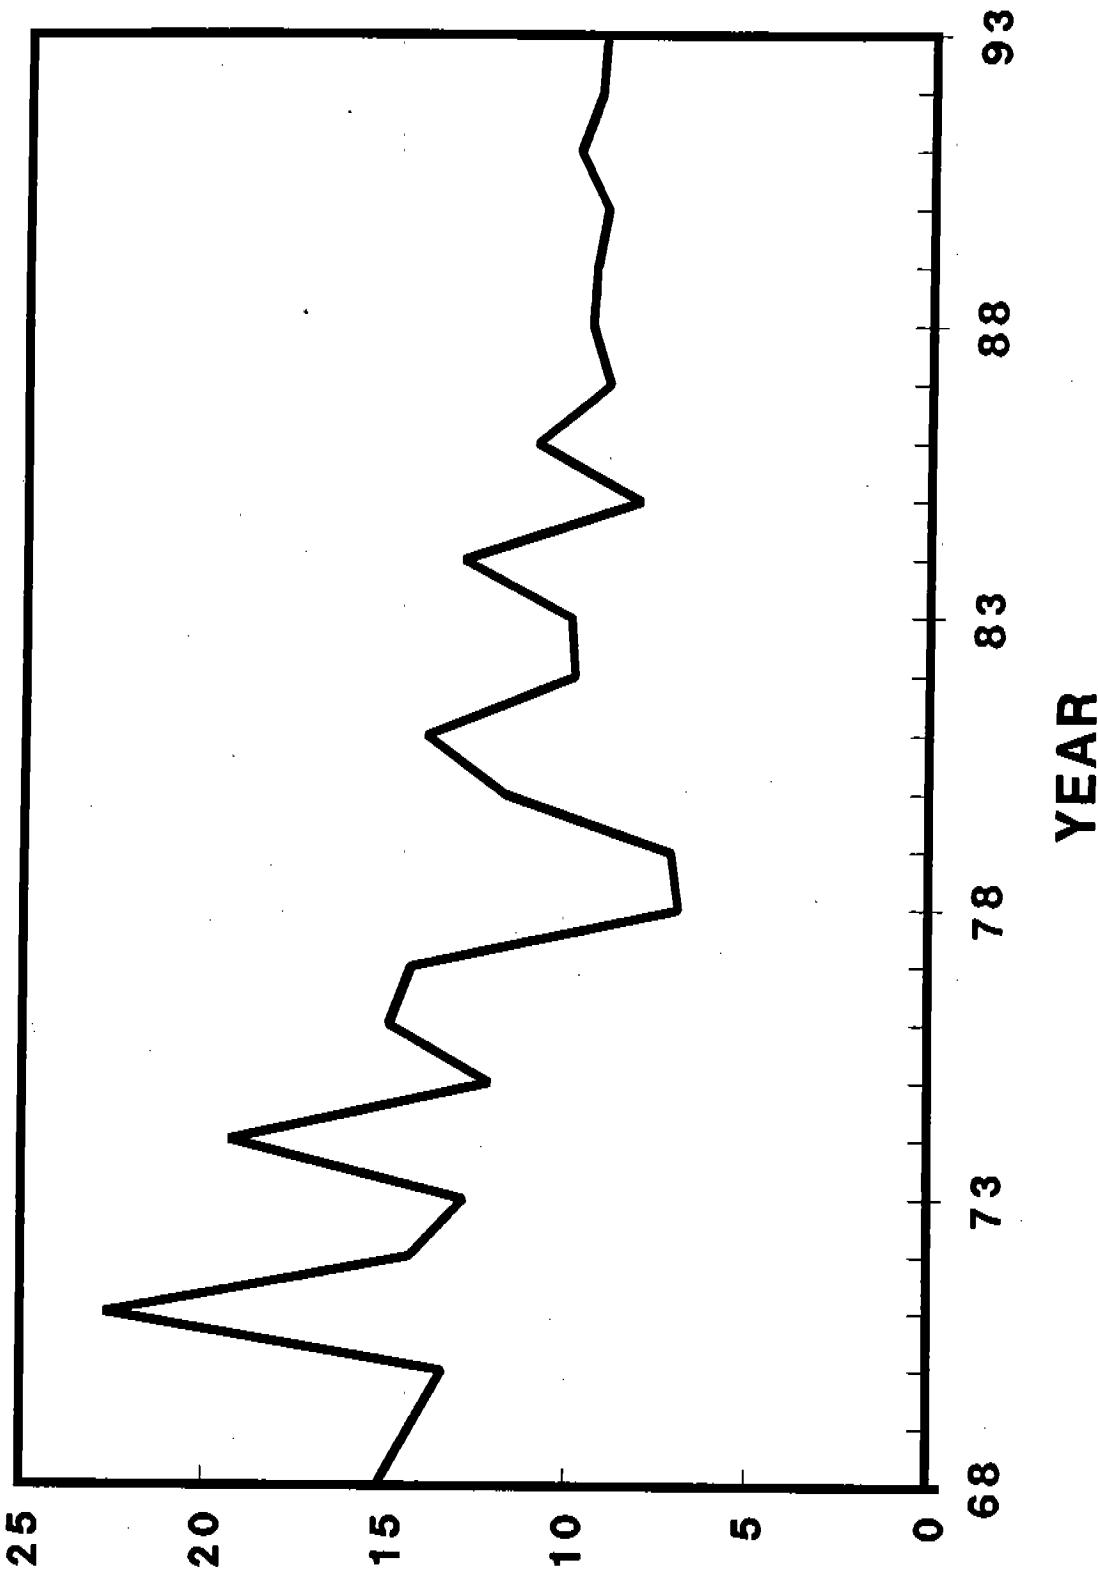

Figure 1. Mourning dove breeding density index trend, 1968-93.

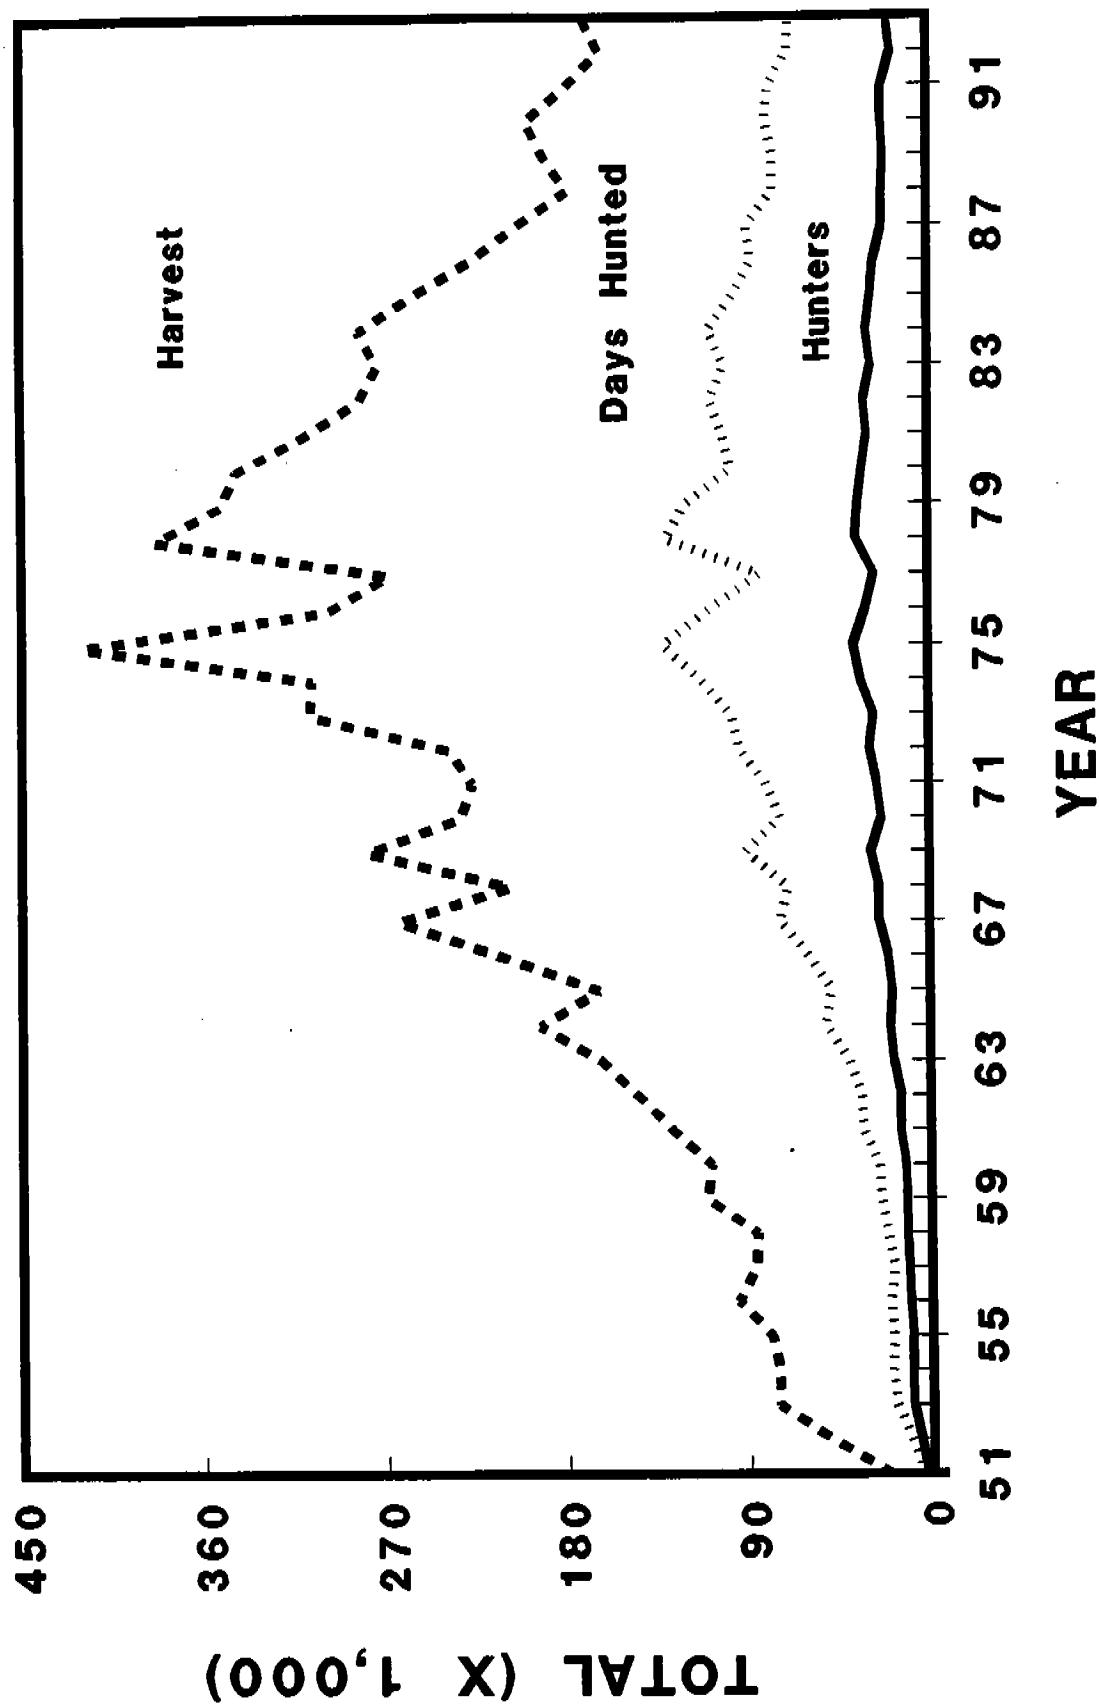

Figure 2. Statewide trends of mourning dove harvest statistics, 1951-93.

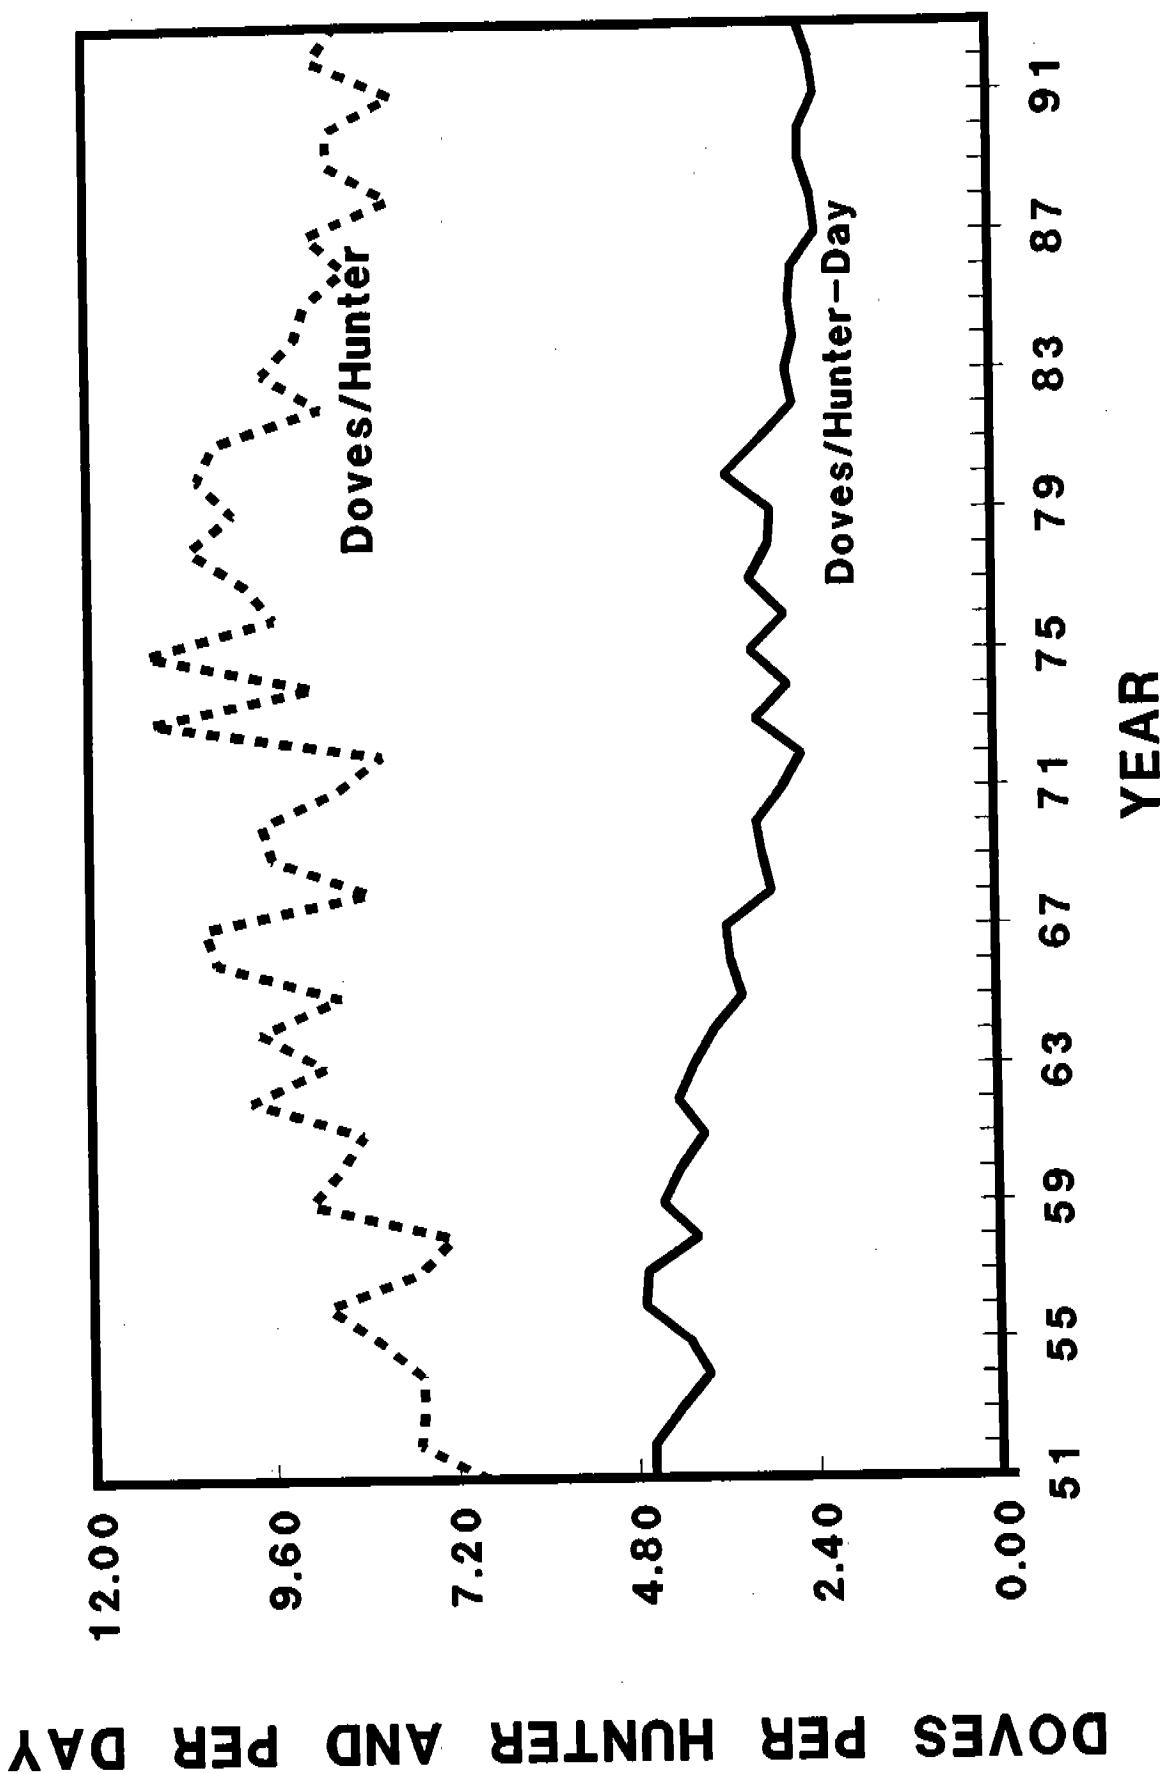

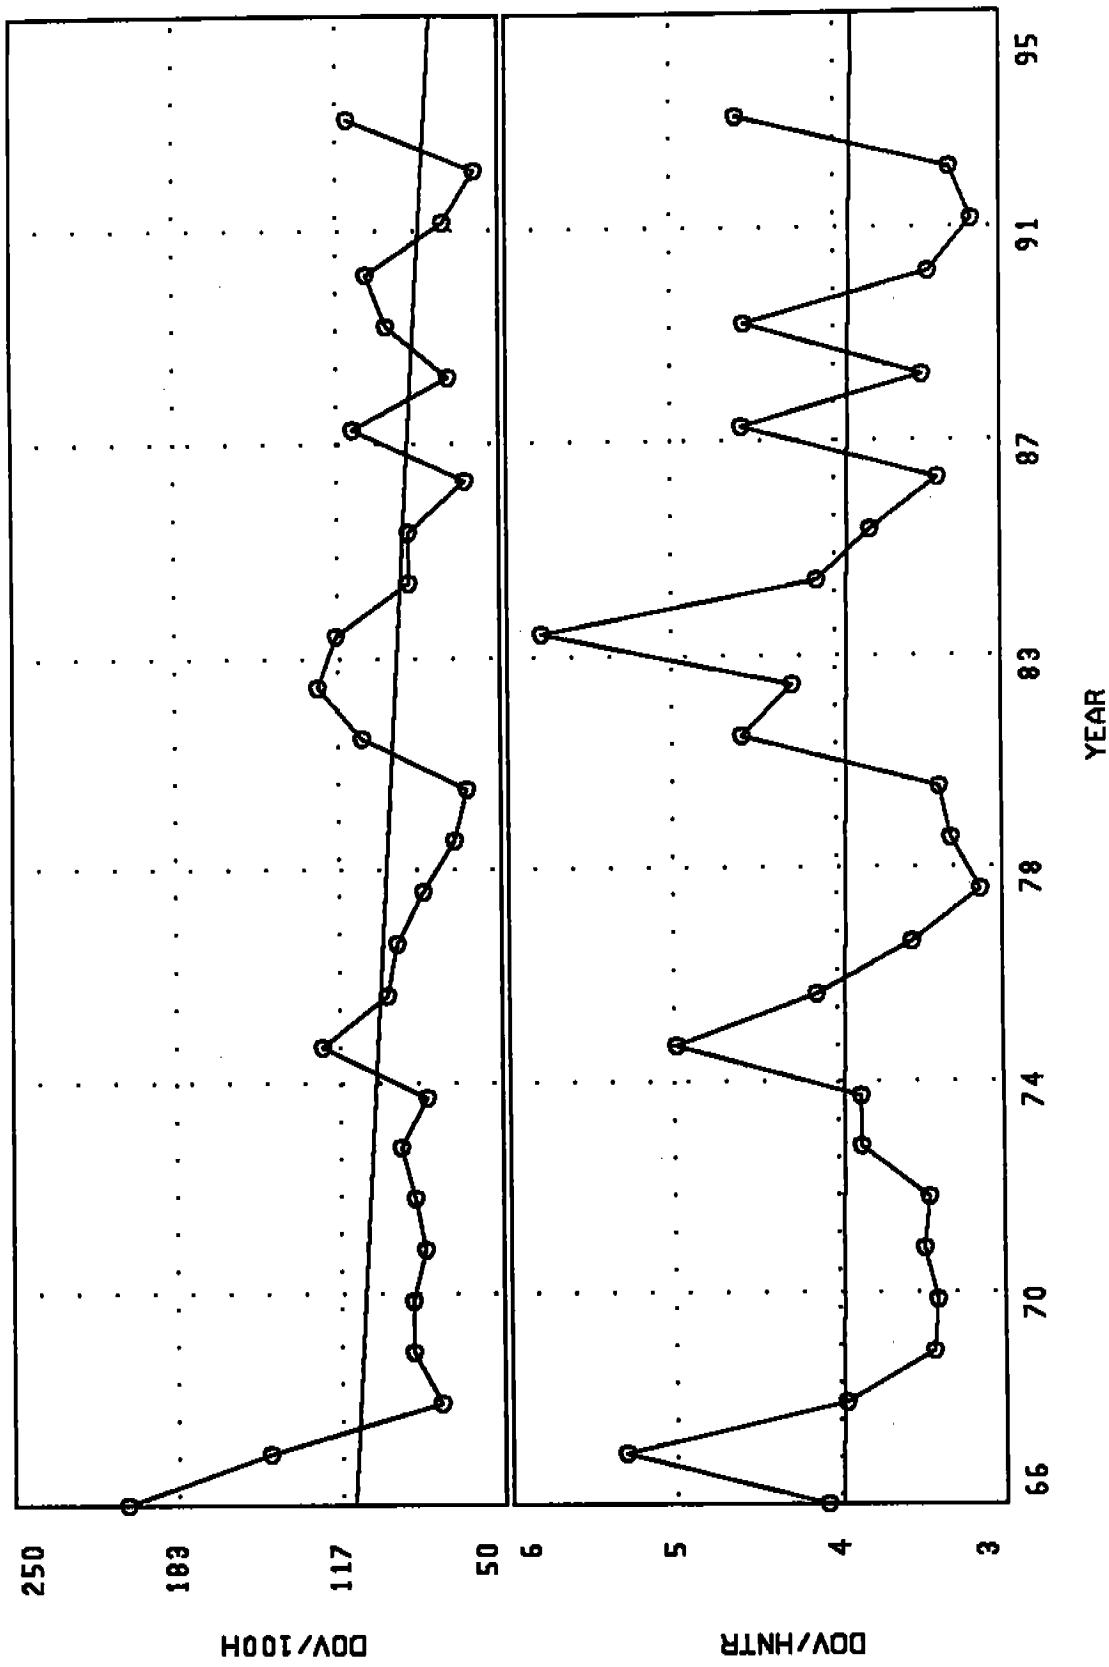

Figure 3. Statewide trends of mourning dove hunter success rates, 1951-93.

FIGURE 4. MOURNING DOVE FIELD BAG  
CHECK INDICES, 1966-93.

#### Field Bag Checks

A summary of field bag check data for 1993 is shown in Table 8. Hunter success trends determined via this method are shown in Table 9. Results of the 1993 survey compared to 1992 and the 10-year average (1983-92) follow:

		<u>Percent change from</u>	
	<u>1993</u>	<u>1992</u>	<u>Average</u>
Total hunters checked	728	+86	-48
Total hours hunted	2,828	+53	-48
Doves per hunter (complete hunts)	4.36	+56	+19
Doves bagged per 100 hours (complete hunts)	112	+87	+28
Average hours per hunter-day (complete hunts)	3.88	-18	-4
Hours hunted per dove bagged (complete hunts)	0.89	+48	-17

Field bag checks indicated an opening day increase in hunter success. The total number of hunters checked was up 86 percent from 1992. Dove hunters spent less time afield per hunter-day than in 1992, and more time was spent per dove bagged, according to field bag check data.

#### Age Composition of the Harvest

A summary of the age composition of harvested mourning doves from 1983 through 1993 is contained in Table 10. Hatching dates for immature doves harvested in the Northern Region since 1982 are shown in Table 11.

Following is a comparison of data collected in 1993 compared to 1992 and long-term averages (1967-92):

		<u>Percent change from</u>	
	<u>1993</u>	<u>1992</u>	<u>Average</u>
Sample size	2,047	+131	-33
Immatures/100 adults	86	-7	-25

Sample size increased 131 percent in 1993. The 86 immatures per 100 adults in the harvest was down 7 percent from the previous year and 25 percent below the long-term average.

## BAND-TAILED PIGEON

### Banding

Between 1969 and 1978, 2,649 total pigeons were banded in Utah and 975 recaptured. Results of banding efforts through 1972 indicated a direct recovery rate of 1.4 percent. If expanded, using an assumed 30 percent band reporting rate, an estimated harvest rate of less than 5 percent of the state's pigeon population is indicated. Addition of an estimated 16 percent crippling loss would result in a total kill rate of from 5-10 percent, well within the harvestable surplus.

### Harvest

Results of the 1993 band-tailed pigeon harvest is in Table 13. Permits were required in 1992 and a questionnaire was sent to participants. Only 13 hunters purchased the \$3.00 band-tailed pigeon permit in 1993. Harvest trends since 1970 are shown in Figures 4 & 5 and Table 14.

	<u>1993</u>	<u>Percent change from 1992</u>	<u>Average</u>
Band-tailed pigeon hunters	8	-56	-84
Band-tailed pigeon harvest	0	--	--
Hunter-days afield	13	-81	-90
Pigeons per hunter-day	--	--	--
Pigeons per hunter	--	--	--

Band-tailed pigeon hunters afield decreased from 1992, and remain 84 percent below the long-term average.

No pigeons were reported harvested in 1993.

# CHUKAR PARTRIDGE

## SUMMARY

The winter of 1992-93 provided continuous snow pack throughout Utah. Undoubtedly this seriously affected over winter survival of chukar.

Late winter and early spring precipitation, critical to successful chukar production, was above average.

Results of the brood survey indicated that brood production was well above average. However, sample sizes were extremely small.

Harvest statistics from mail questionnaires reflected a decrease in harvest. Hunter success (chukars per hunter-day) decreased 28 percent from 1992. Chukar hunters decreased by 9 percent, while time afield decreased 9 percent from the year before.

### Brood Counts

Results of the annual random brood survey for 1993 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and chukars observed per 100 hours are found in Tables 2-4 and Figure 1. Following are the survey results for 1993 compared to 1992 and the 10-year (1983-92) average:

	<u>1993</u>	<u>Percent change from 1992</u>	<u>Average</u>
Total chukars observed	454	+260	0
Young per 100 adults	373	+73	-19
Mean brood size	5.67	-28	-23
Chukars observed per 100 hours	2,064	+932	+394
Total hours effort	22	-65	-80

Winter and early spring precipitation (January-April) was above average over the entire state (Figure 4). Summer temperatures were below normal over most of Utah from June through November.

Effort on chukar brood counts decreased significantly in 1993 and remained well below average.

Brood count sample sizes were extremely small or nonexistent for all regions. Brood count data was reported only in the Southeastern Region. Because of extremely small sample sizes, this data can only represent localized population trends.

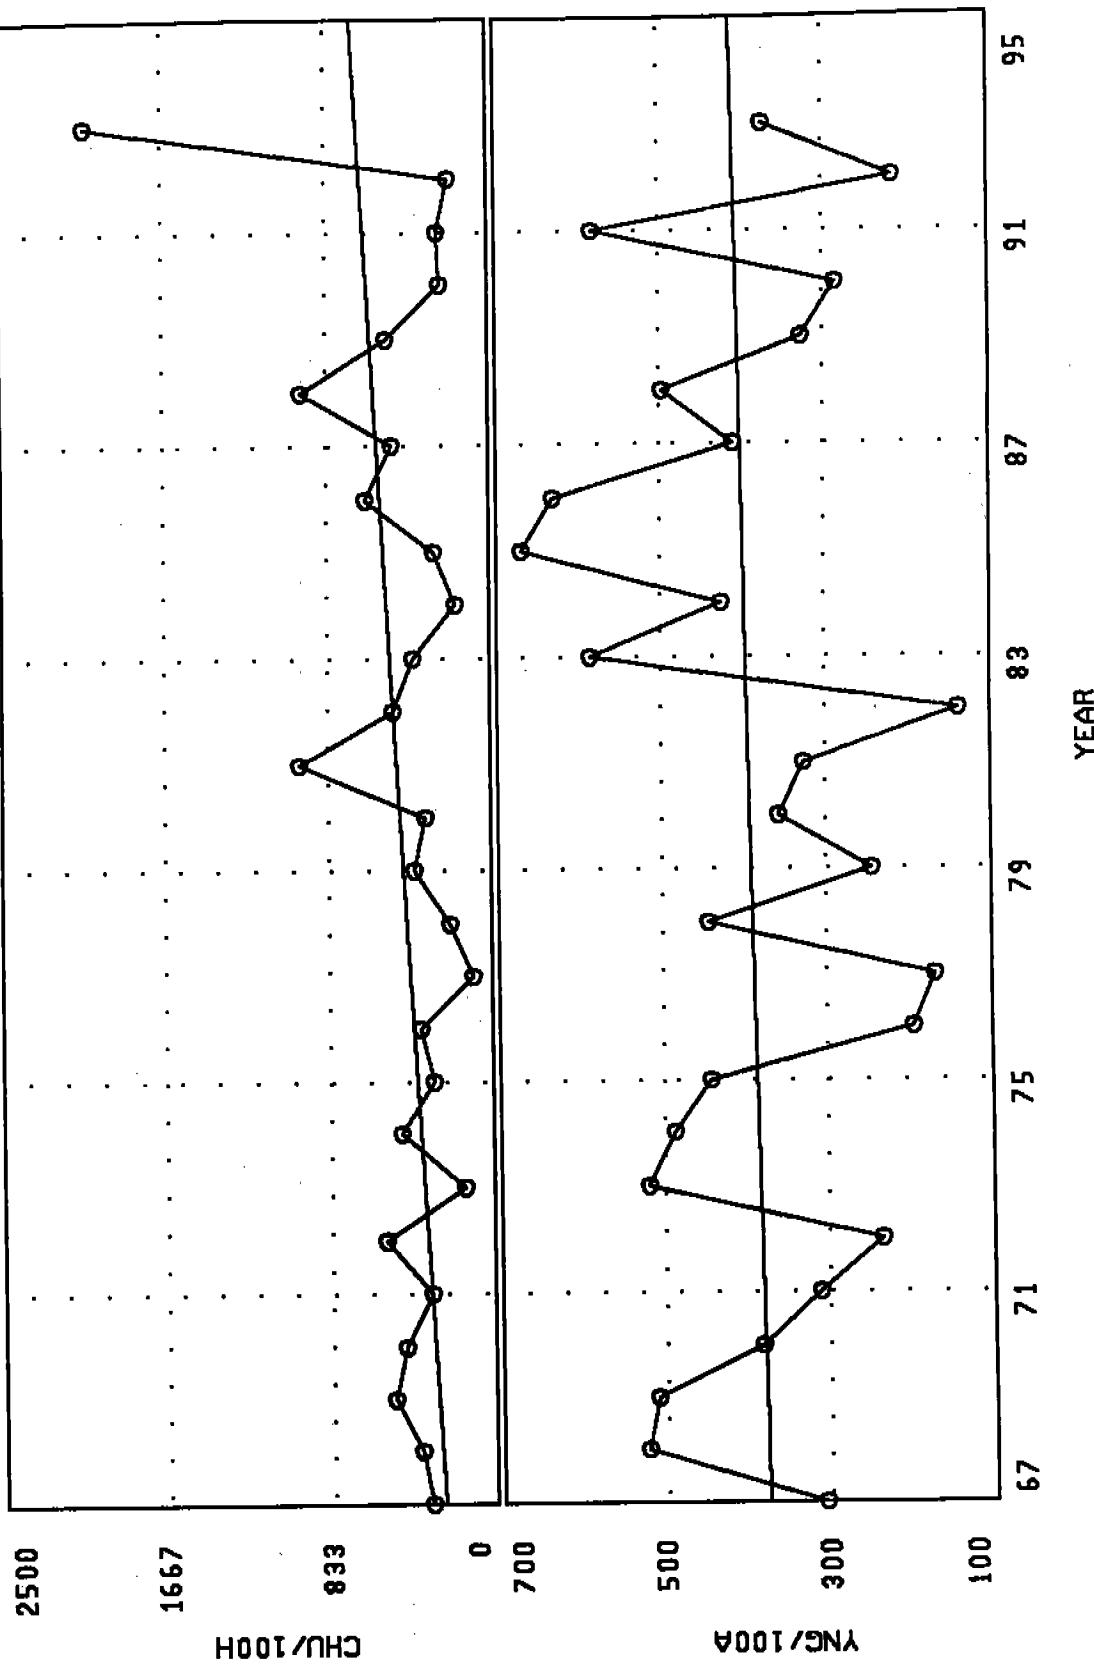

### Harvest

#### Hunter Questionnaire

Results of the hunter questionnaire survey for 1993 are shown in Table 5. Long-term trends of chukars bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9 and Figures 2 and 3. Following is a comparison of 1993 harvest statistics to 1992 and the previous 35-year average:

	<u>1993</u>	<u>Percent change from 1992</u>	<u>Average</u>
Chukar hunters	10,128	-9	-27
Chukars harvested	18,774	-34	-52
Hunter-days afield	34,147	-9	-19
Chukars per hunter-day	0.55	-28	-39
Chukars per hunter	1.85	-28	-32

FIGURE 1. CHUKAR PRODUCTION  
INDICES, 1967-93.

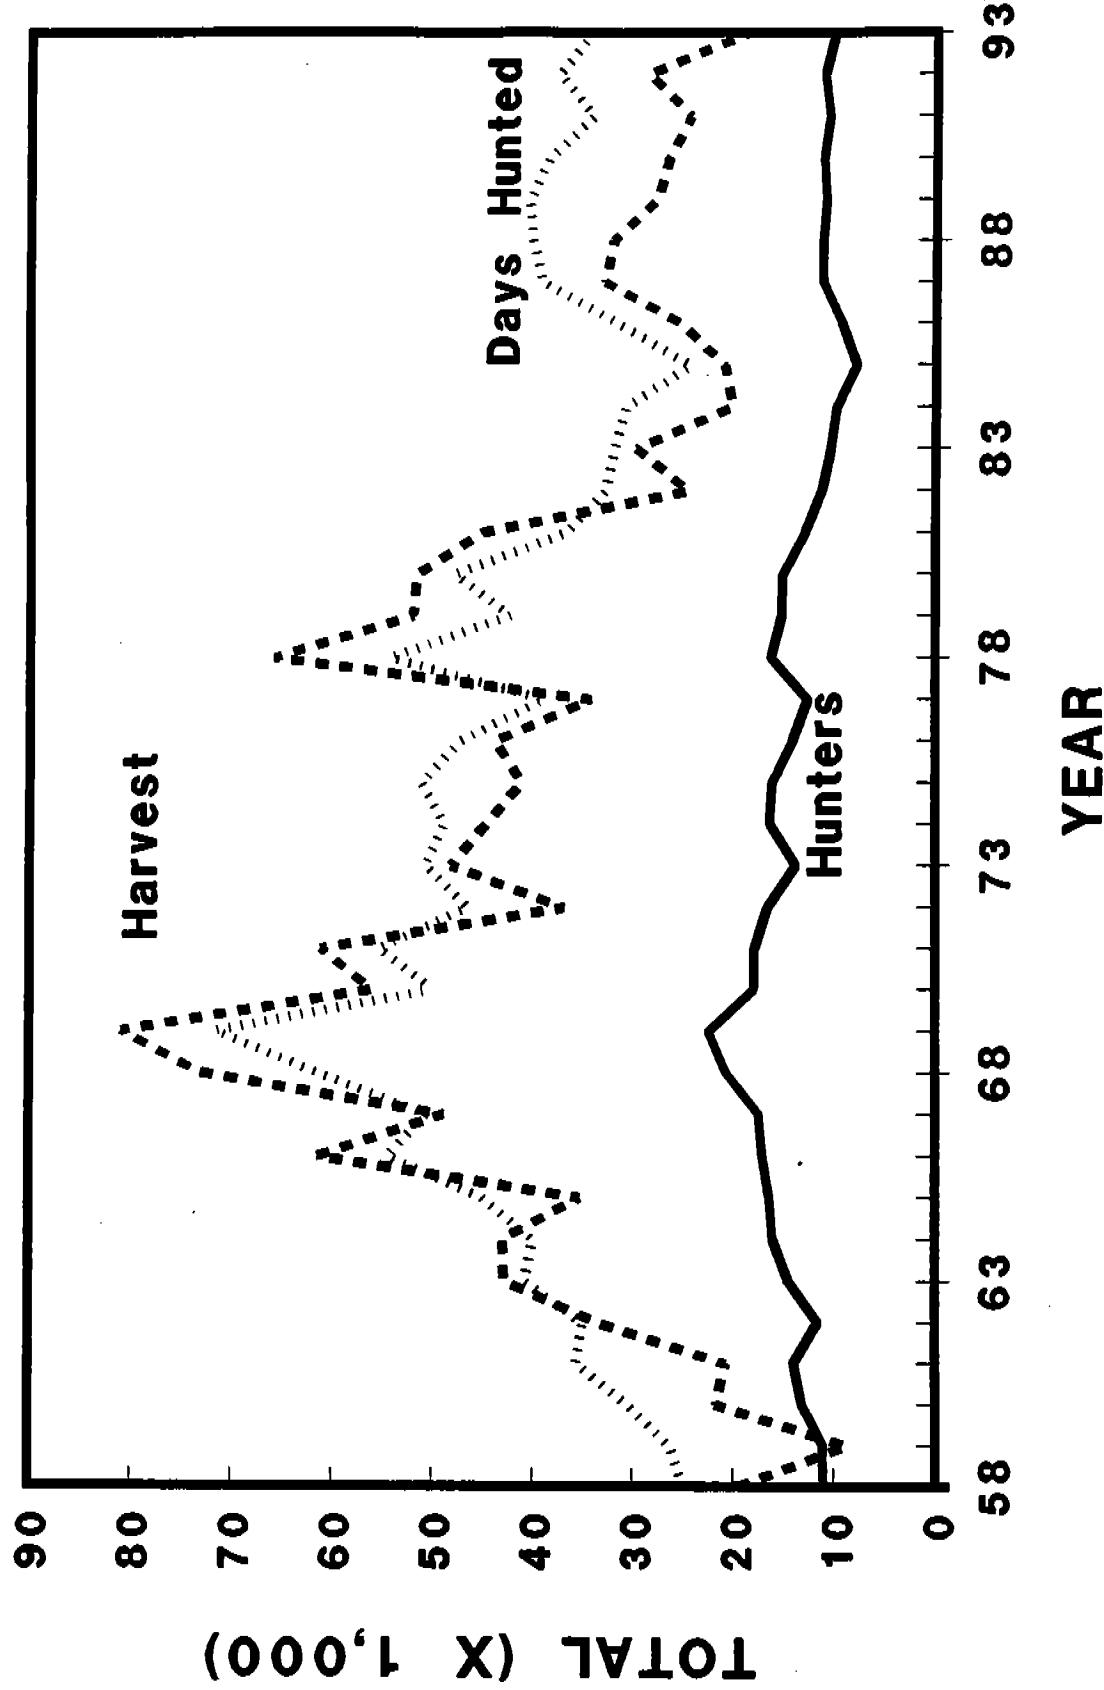

Figure 2. Statewide trends of chukar partridge harvest statistics, 1958-93.

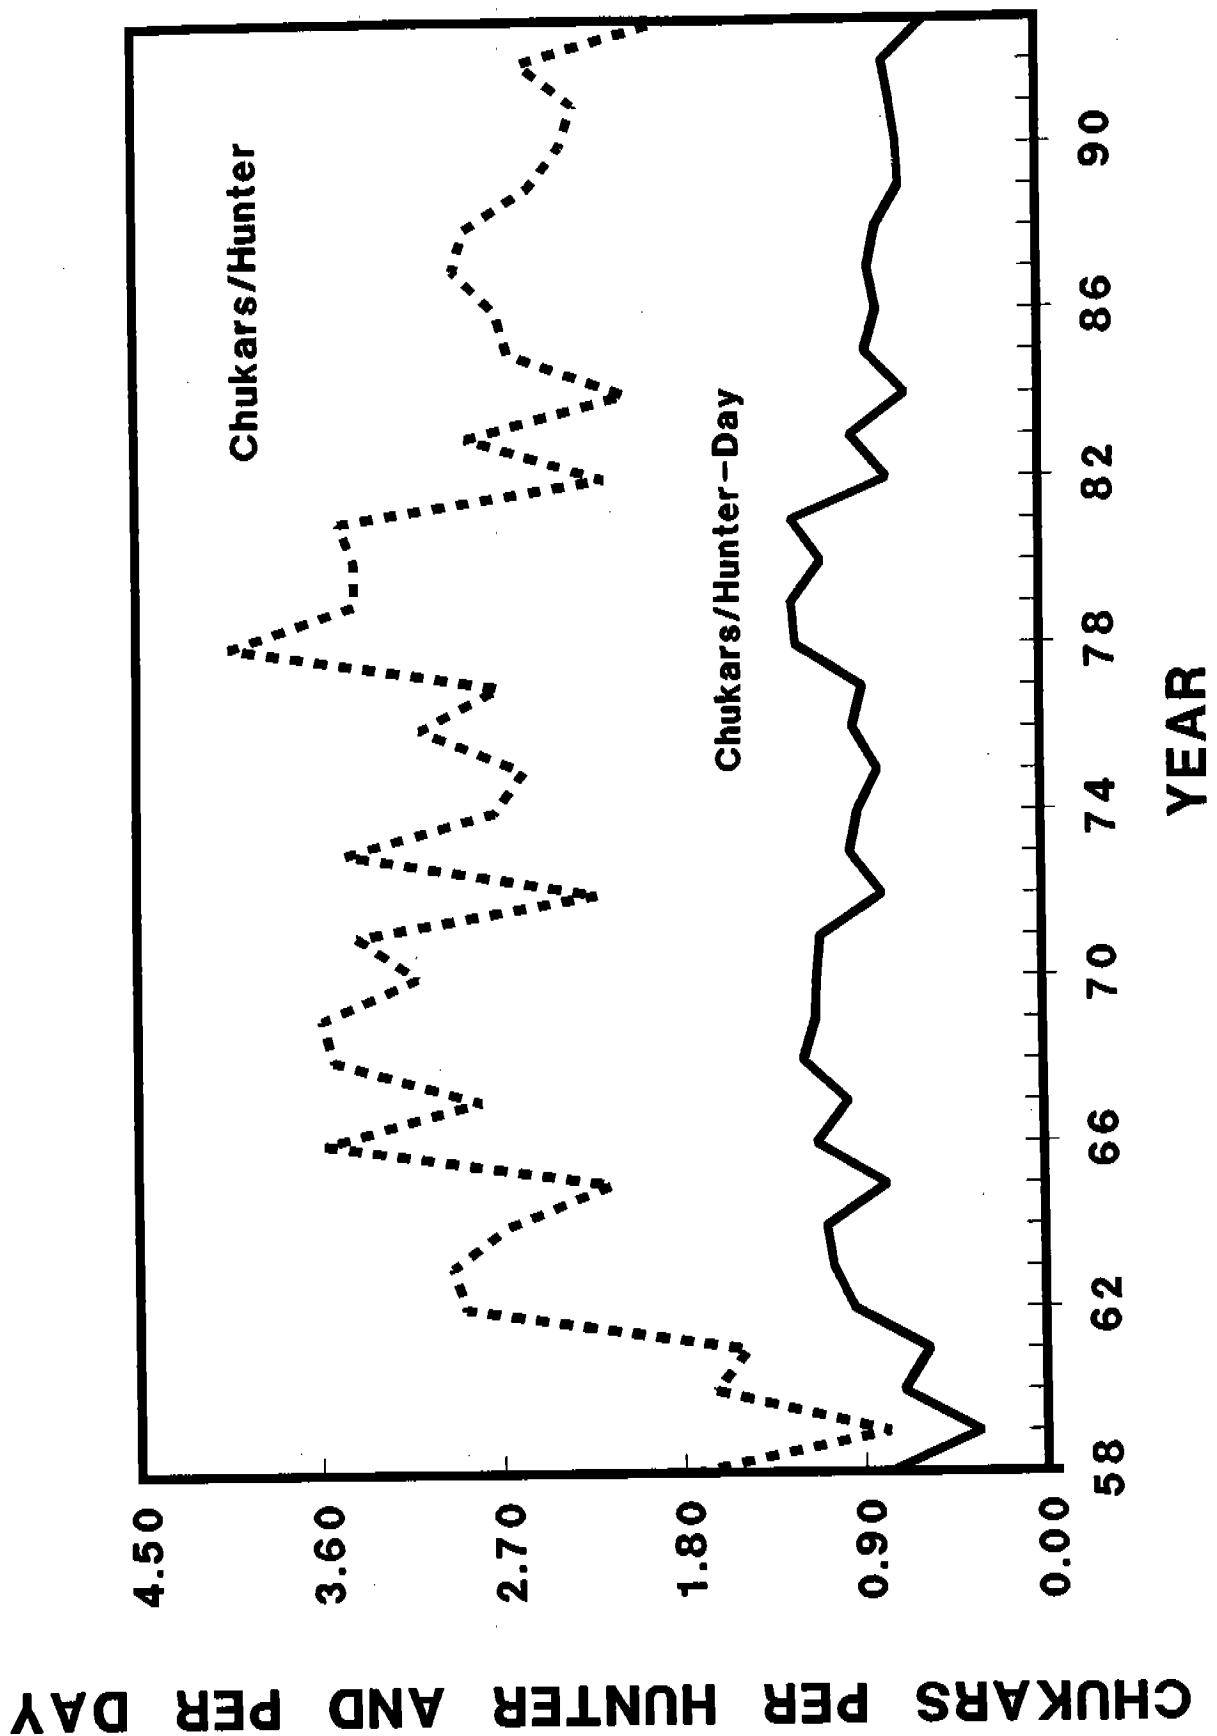

Figure 3. Statewide trends of chukar hunter success rates, 1958-93.

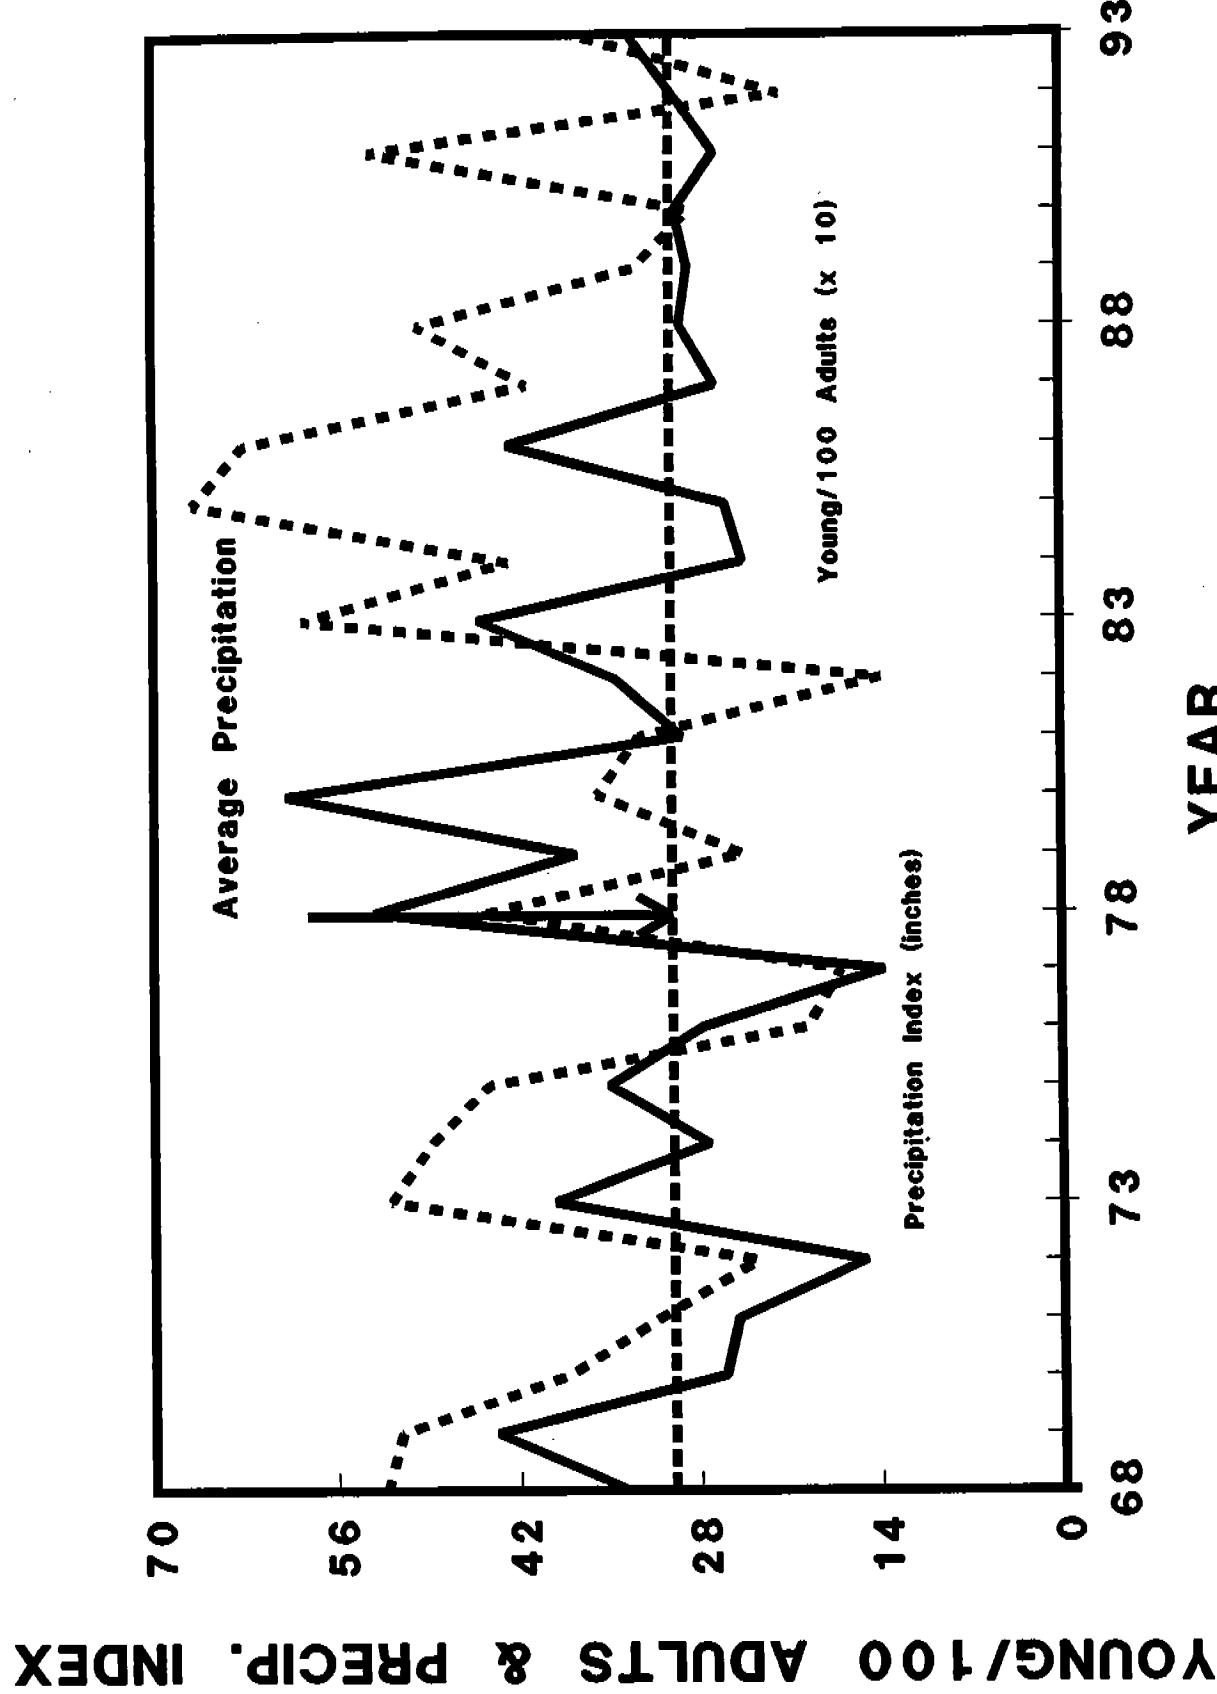

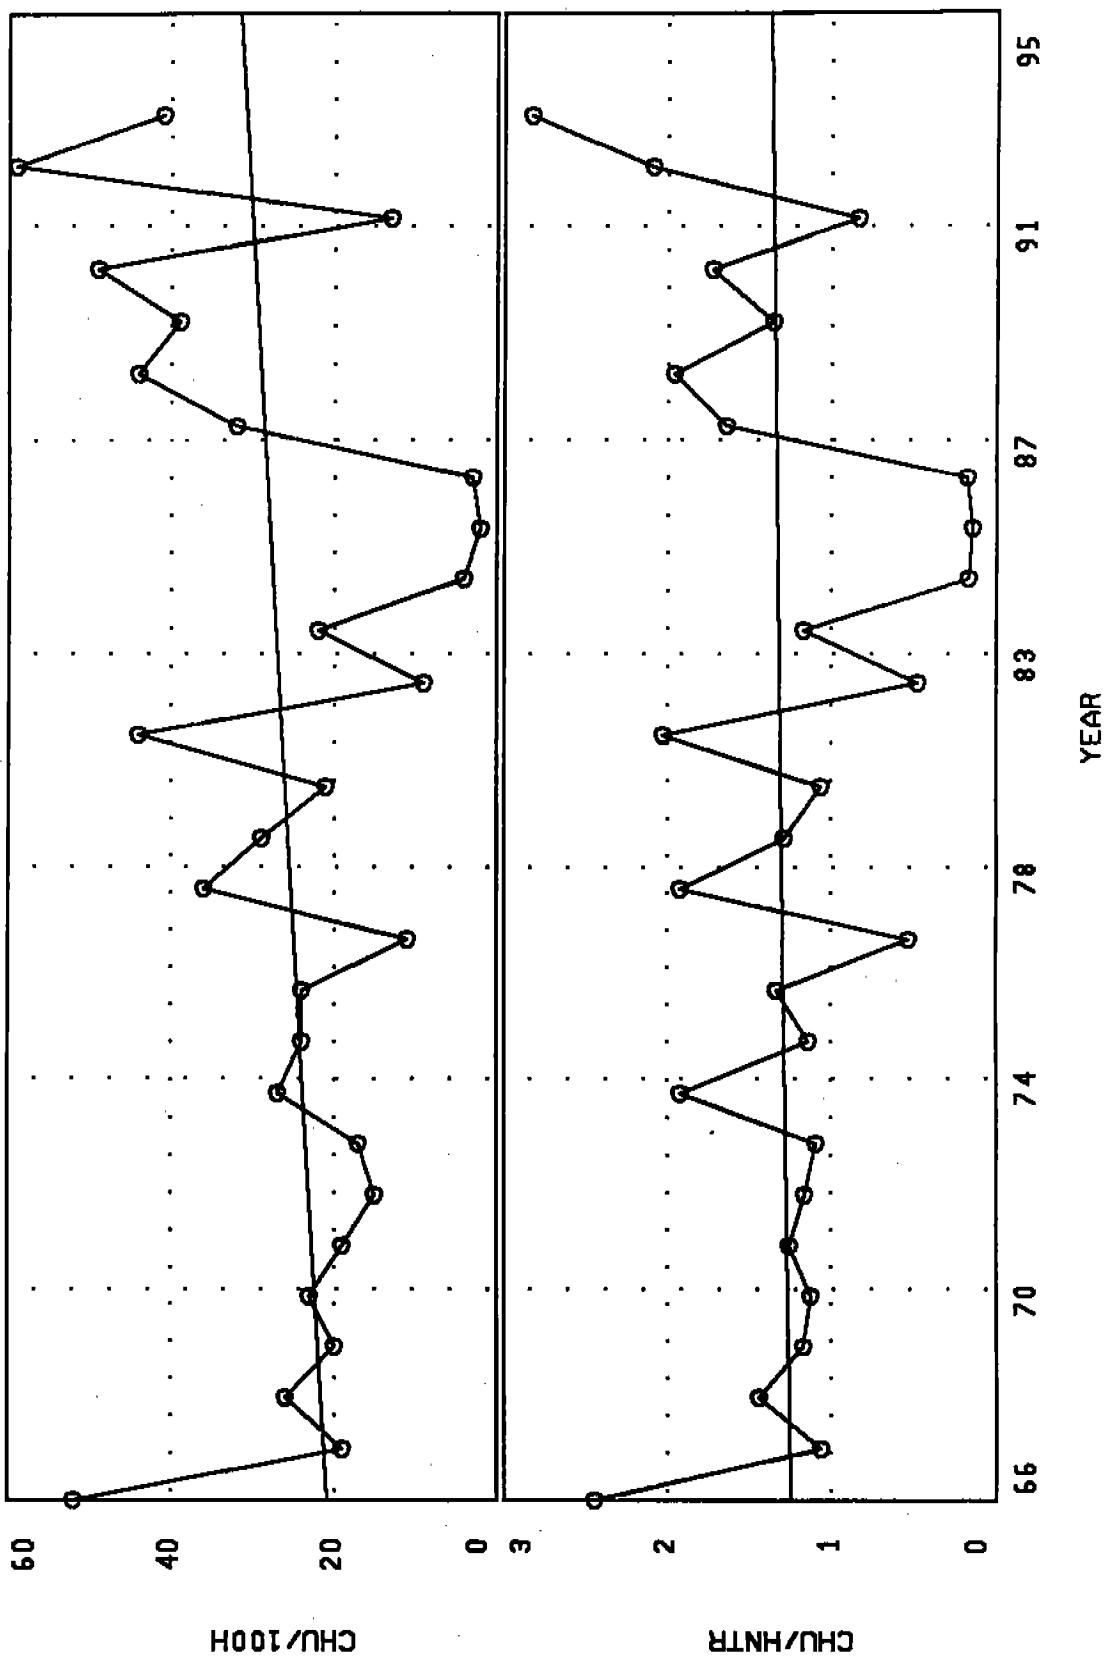

Figure 4. Relationship between late winter and early spring (Jan.-April) precipitation and chukar production, 1968-93.

FIGURES 5. CHUKAR FIELD BAG CHECK  
INDICES, 1966-93.

Chukar hunters and hunter effort decreased from 1992. Chukars per hunter-day decreased from 1992, and remains 39 percent below the statewide average. Total harvest decreased 34 percent. The Central Region again had the highest percentage of the harvest (43%) in 1993, and also had the highest percentage of hunter pressure (44%).

#### Field Bag Checks

A summary of field bag check data for 1993 is shown in Table 10. The hunter success trend determined by field bag checks since 1987 is shown in Table 11 and Figure 5. Data for the 1993 season compared to 1992 and the 10-year (1983-92) average follow:

		Percent change from	
	1993	1992	Average
Total hunters checked	11	-59	-94
Total hours hunted	63	-20	-93
Chukars per hunter (complete hunts)	2.36	+36	+151
Chukars bagged per 100 hours (complete hunts)	41	+31	+50
Average hours per hunter-day (complete hunts)	2.90	-1	-32
Hours hunted per chukar bagged (complete hunts)	2.42	+44	-83

Field bag check data sample sizes are too small to draw any conclusions.

# SAGE GROUSE

## SUMMARY

Strutting ground surveys indicated a decrease in the average male grouse attendance from 1992.

Brood surveys showed decreased production per adult hen throughout the state. Birds observed per 100 hours decreased 55 percent from 1992, and was 58 percent below average. However, the ratio of young to adults increased 120 percent compared to 1992, and was 45 percent above average.

The decrease in production, as indicated from brood counts, in 1993, was apparent in harvest statistics collected from questionnaires and from field bag checks. Harvest was 16 percent below the 42-year average. Age ratios derived from wings indicated a 45 percent increase in young per 100 adults and was 6 percent above average. However, young per adult hen decreased 31 percent and remains 48 percent below the long-term average.

### Strutting Ground Counts

The status of the sage grouse breeding population for 1993, as indicated by strutting ground counts, is shown in Table 1 and Figure 1 of this section. Results of this survey for 1993 compared to 1992 and the 1967-92 average follow:

		<u>Percent change from 1992</u>	<u>Average</u>
Number of grounds counted	90	-28	-17
Total male grouse counted	1,122	-45	-45
Average male grouse per ground	12	-25	-35
Percent change from previous year (comparable grounds)	--		

Access for spring 1993 strutting ground counts was generally poor in most regions of the state. The numbers of male grouse observed decreased 45 percent statewide. Loss of habitat continues to be the trend in many areas of the state.

### Brood Counts

Results of the summer inventory survey for 1993 are found in Table 2. Long-term trends of young per adult ratios, mean brood size and sage grouse observed per 100 hours are shown in Tables 3-5 and Figure 2. Indices for 1993 are compared to 1992 and the previous 10-year (1983-92) average as follows:

		<u>Percent change from 1992</u>	<u>Average</u>
Total sage grouse counted	170	-76	-84
Young per 100 adults	209	+120	+45
Mean brood size	3.68	-13	-16
Sage grouse observed per 100 hours	122	-55	-58
Total hours effort	140	-46	-62

The effort devoted to sage grouse brood counts was 62 percent below average, and the total number of grouse counted was 84 percent below average.

Sage grouse density decreased in 1993, while production of young per 100 adults increased 120 percent. The average brood size was 16 percent below the 10-year average.

FIGURES. SAGE GROUSE FIELD BAG  
CHECK INDICES, 1966-93.

## Harvest

### Hunter Questionnaire

Results of the 1993 hunter questionnaire are shown in Table 6. Long-term trends of sage grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 7-9 and total statewide harvest statistics in Table 10. The results of the 1993 hunting season compared to 1992 and the previous 43-year average follow:

		<u>Percent change from</u>	
	<u>1993</u>	<u>1992</u>	<u>Average</u>
Sage grouse hunters	6,594	-11	-11
Sage grouse harvested	9,311	-23	-16
Hunter-days afield	14,480	-8	+10
Sage grouse per hunter-day	0.64	-17	+4
Sage grouse per hunter	1.41	-14	-23

Sage grouse per hunter-day success rate decreased 17 percent in 1993. Total statewide harvest decreased 23 percent, and there was an 11 percent decrease in total sage grouse hunters. Thirty-nine percent of the harvest and 42 percent of the hunting pressure still occurred in the Northern region.

Long-term sage grouse harvest trends are shown in Figures 3 and 4.

### Field Bag Checks

A summary of field bag check data for 1993 is shown in Table 11. Hunter success trends determined via this method are shown in Table 12 and Figure 5. Results of the 1993 survey compared to 1992 and the 10-year (1983-92) average follow:

		<u>Percent change from</u>	
	<u>1993</u>	<u>1992</u>	<u>Average</u>
Total hunters checked	414	-28	-58
Total hours hunted	2,763	-24	-42
Sage grouse per hunter (complete hunts)	0.66	-25	-36
Sage grouse bagged per 100 hours	10	-29	-49
Average hours per hunter-day (complete hunts)	6.67	+5	+27
Hours hunted per grouse bagged (complete hunts)	10.16	+40	+81

Hunter success rates from field bag checks showed decreased success for 1993 and more time was spent afield per grouse bagged.

### Sex and Age Composition of the Harvest

A summary of the sex and age composition of harvested sage grouse in 1993 is found in Table 13 and the trend from 1990-93 in Table 14.

Following are data derived from wing surveys in 1993 compared to 1992 and the 1983-92 average:

		<u>Percent change from</u>	
	<u>1993</u>	<u>1992</u>	<u>Average</u>
Sample size	620	-33	-30
Percent males	35	-15	-14
Percent females	65	+10	+10
Young per 100 adults	155	+45	+6
Young per 100 hens (adult)	116	-31	-48

Analysis of wings collected at checking stations during the 1993 season indicates that statewide production was down 48 percent compared to 1992, and was below the long-term average.

\* The number of sage grouse hunters and consequently harvest was limited by permits available from 1951 through 1962.

\*\* Estimated.

\*\*\* Totals and indices based on indiscrete data.

# **FOREST GROUSE**

## **SUMMARY**

Production of blue and ruffed grouse increased and decreased respectively from 1992. A total of 14 forest grouse broods were observed during 1993 compared with 44 in 1992, 51 in 1991 and 59 in 1990.

Total harvest decreased from 44,518 in 1992 to 18,147 in 1993, a 22 percent decrease. Total hunters and days afield also decreased.

### Brood Counts

#### Ruffed Grouse

Results of the annual random brood survey for 1993 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and ruffed grouse observed per 100 hours are found in Tables 2-4. A summary of effort expended on ruffed and blue grouse brood counts combined is shown in Table 9. Survey results for 1993 compared to 1992 and the previous 10-year average (1983-1992) follow:

		<u>Percent change from 1992</u>		<u>Average</u>
	<u>1993</u>			
Total ruffed grouse observed	2	-96		-97
Young per 100 adults	100	-63		-68
Mean brood size	1.00	-76		-76
Ruffed grouse observed per 100 hours	2	-94		-94
Total hours effort	110	-39		-62

Effort on brood surveys decreased by 39 percent and was 62 percent below average.

Grouse observed per 100 hours was 94 percent below average, while mean brood size was 76 percent below average indicating decreased production.

#### Blue Grouse

Results of the annual random brood survey for 1993 are shown in Table 5 of this section. Long-term trends of young per adult ratios, mean brood size and blue grouse observed per 100 hours are found in Tables 6-8. Survey results for 1993 compared to 1992 and the previous 10-year average (1983-92) follow:

		<u>Percent change from 1992</u>		<u>Average</u>
	<u>1993</u>			
Total blue grouse observed	53	-75		-85
Young per 100 adults	308	+27		+30
Mean brood size	3.08	-28		-18
Blue grouse observed per 100 hours	48	-63		-57
Total hours effort (forest grouse)	110	-34		-65

The 1993 summer surveys on blue grouse indicated that production increased (27 percent) from 1992 and was 30 percent above average.

Total observations decreased 75 percent, with a 34 percent decrease in effort. The number of grouse observed per 100 hours of effort decreased from 1992 and was 57 percent below average.

### Harvest

#### Hunter Questionnaire

Results of the 1993 blue grouse, ruffed grouse and combined hunter questionnaire are shown in Table 10, 11 and 12 respectively. Long-term trends of forest grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 13-15 and total statewide harvest statistics in Table 16 and Figures 1 and 2. Forest grouse season length, bag limits and harvest statistics, 1963-1993 are listed in Table 17. Harvest statistics for 1993 compared to 1992 and the previous 30-year average follow:

		Percent change from	
	1993	1992	Average
Forest grouse hunters	12,029	-4	-18
Forest grouse harvested	18,147	-22	-49
Hunter-days afield	36,390	-8	-2
Forest grouse per hunter-day	0.50	-15	-48
Forest grouse per hunter	1.51	-19	-35
Percent ruffed grouse	36.65	+3	-5
Percent blue grouse	60.84	-7	+10
Percent unidentified	2.52	+444	-58

Total harvest increased 22 percent from 1992 and was 49 percent below average. Overall, hunter success (grouse per hunter-day) was 48 percent below average and the number of grouse harvested per hunter was 35 percent below average. Hunter pressure decreased and remains 18 percent below the long-term average.

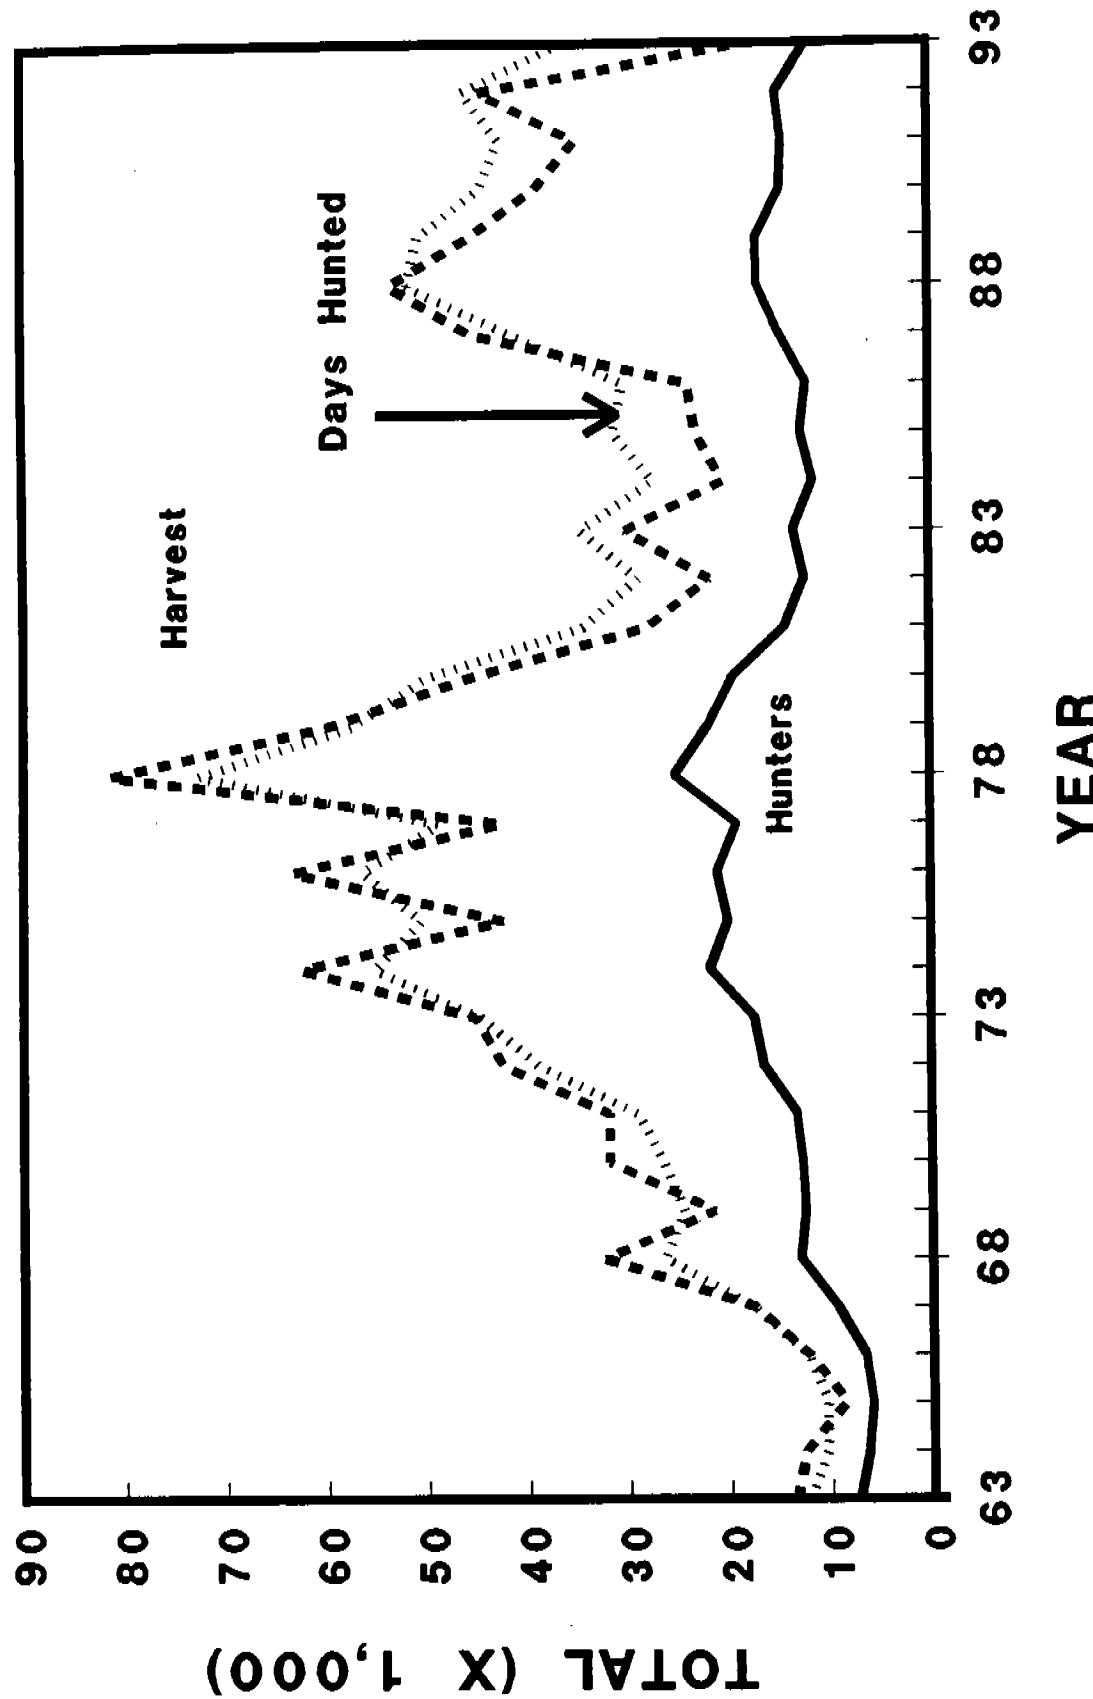

Figure 1. Statewide trends of forest grouse harvest statistics, 1963-93.

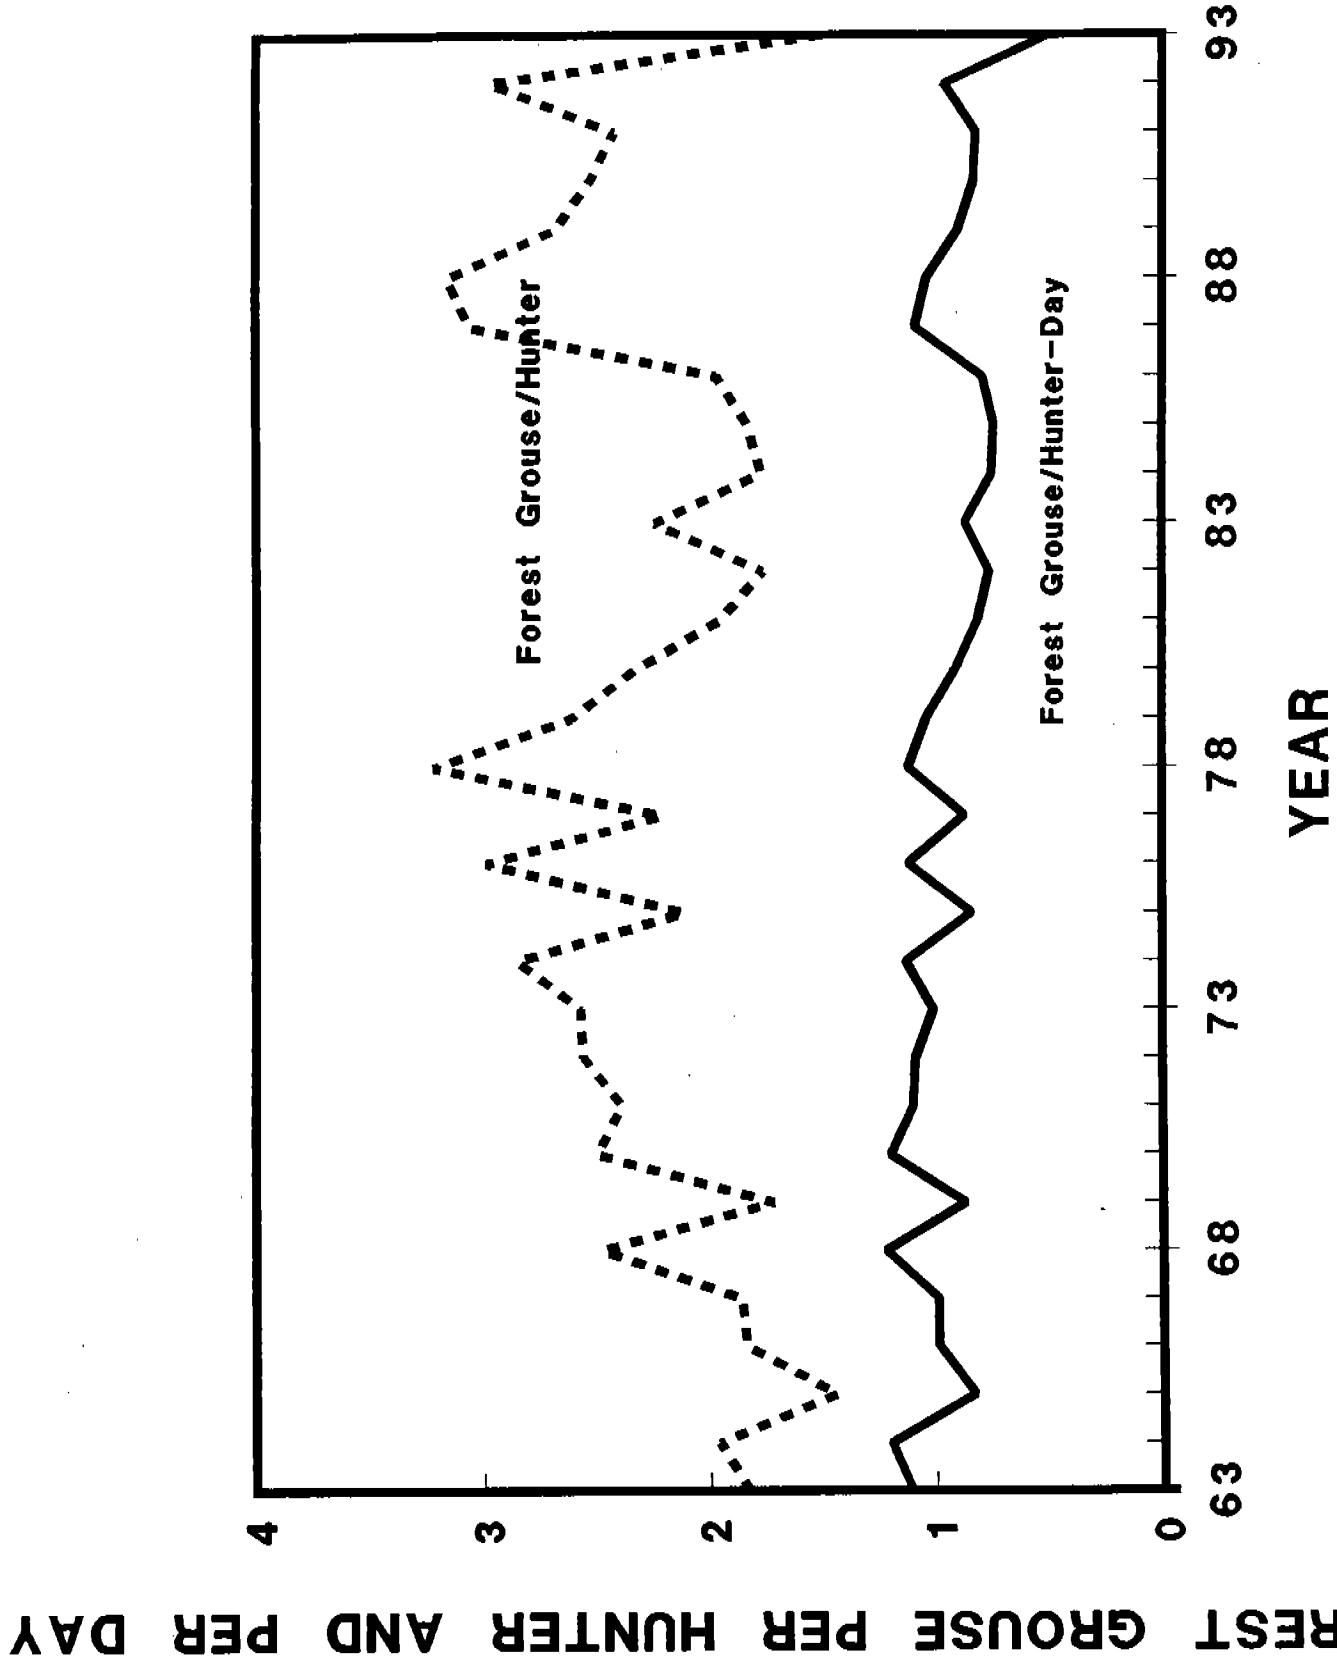

Figure 2. Statewide trends of forest grouse hunter success rates, 1963-93.

#### Field Bag Checks

No field bag check data was collected in 1993 (Table 18). Hunter success trends determined via this method are shown in table 19. Sex and age composition of the harvest as determined from wings is shown in Table 20 and 21.

\* Season opener changed to the second Saturday in September from the third Saturday in September.

\*\* From 1950 to 1963 a grouse stamp was required to hunt any grouse. In 1964, the entire state was opened to hunting without a stamp.

# **QUAIL**

## **SUMMARY**

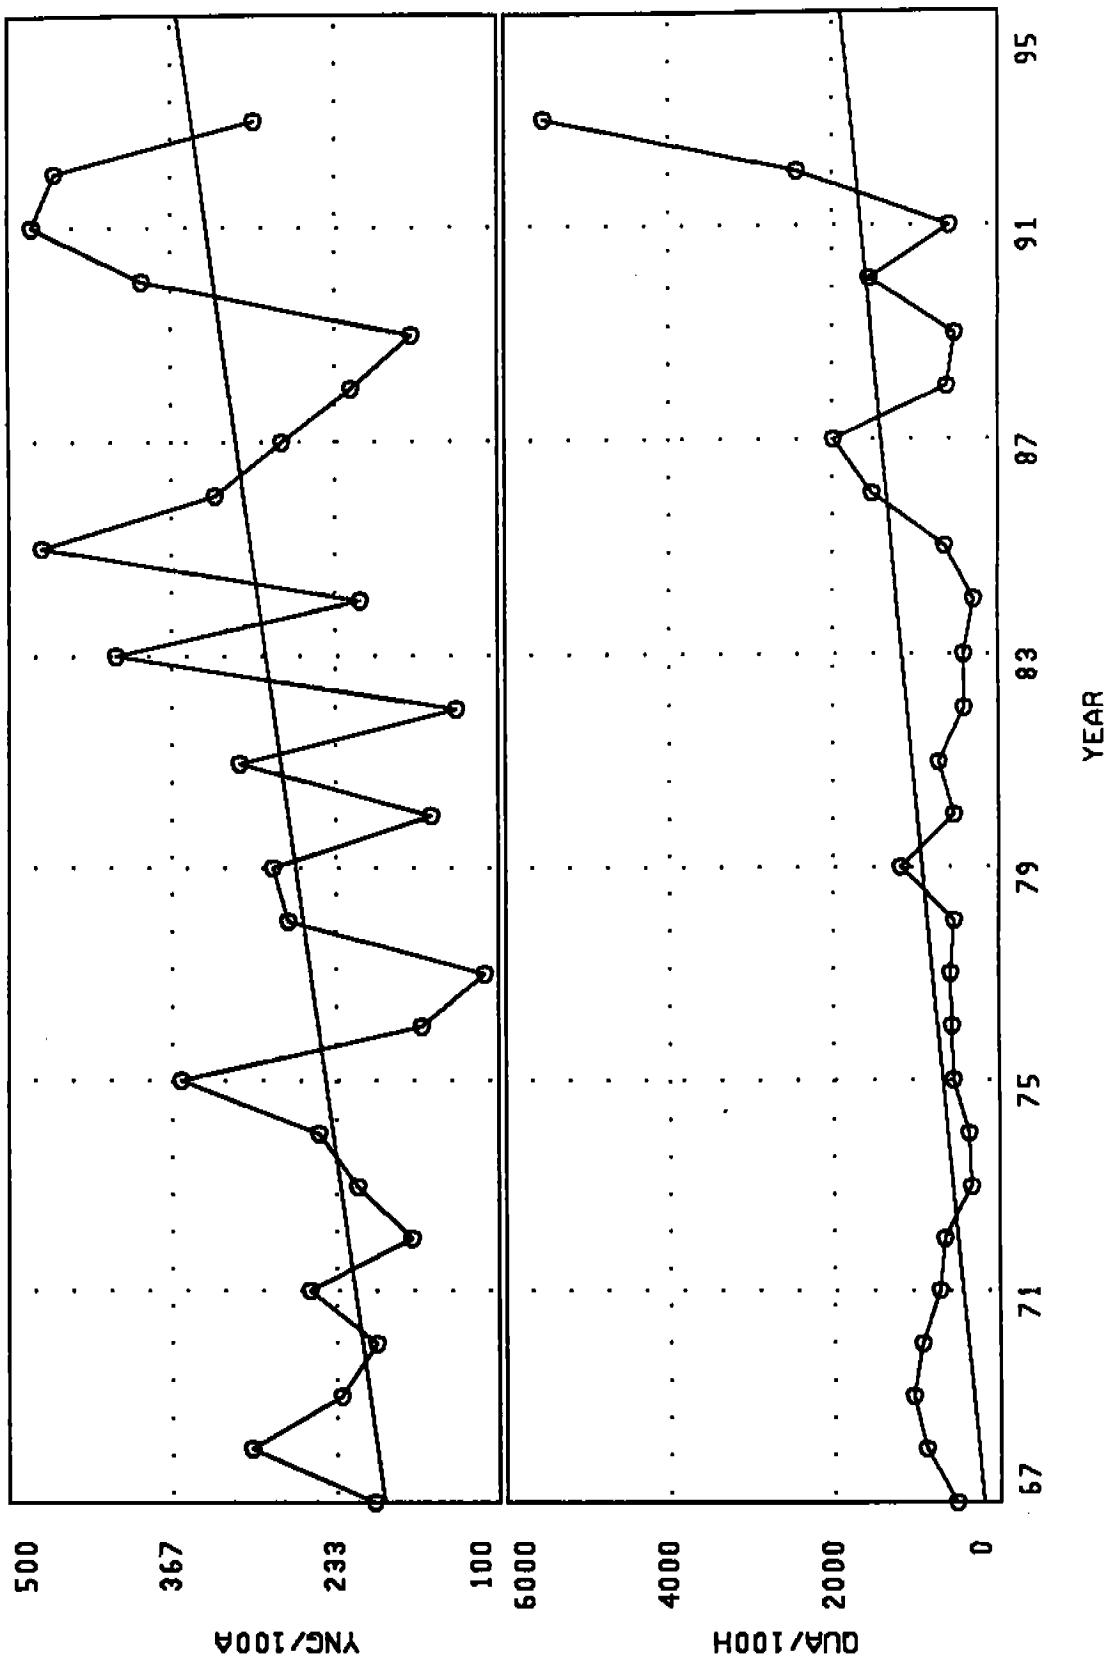

Production of California and Gambel's quail decreased slightly from 1992.

Statewide harvest statistics, when compared to 1992, showed an increase in total hunters and in total harvest. Hunter success (birds per hunter-day) increased 12 percent and remained below average statewide. Hunter-days afield increased 48 percent from 1992. The Southern Region accounted for 57 percent of the statewide quail harvest and 43 percent of quail hunter pressure.

INDICES, 1967-93

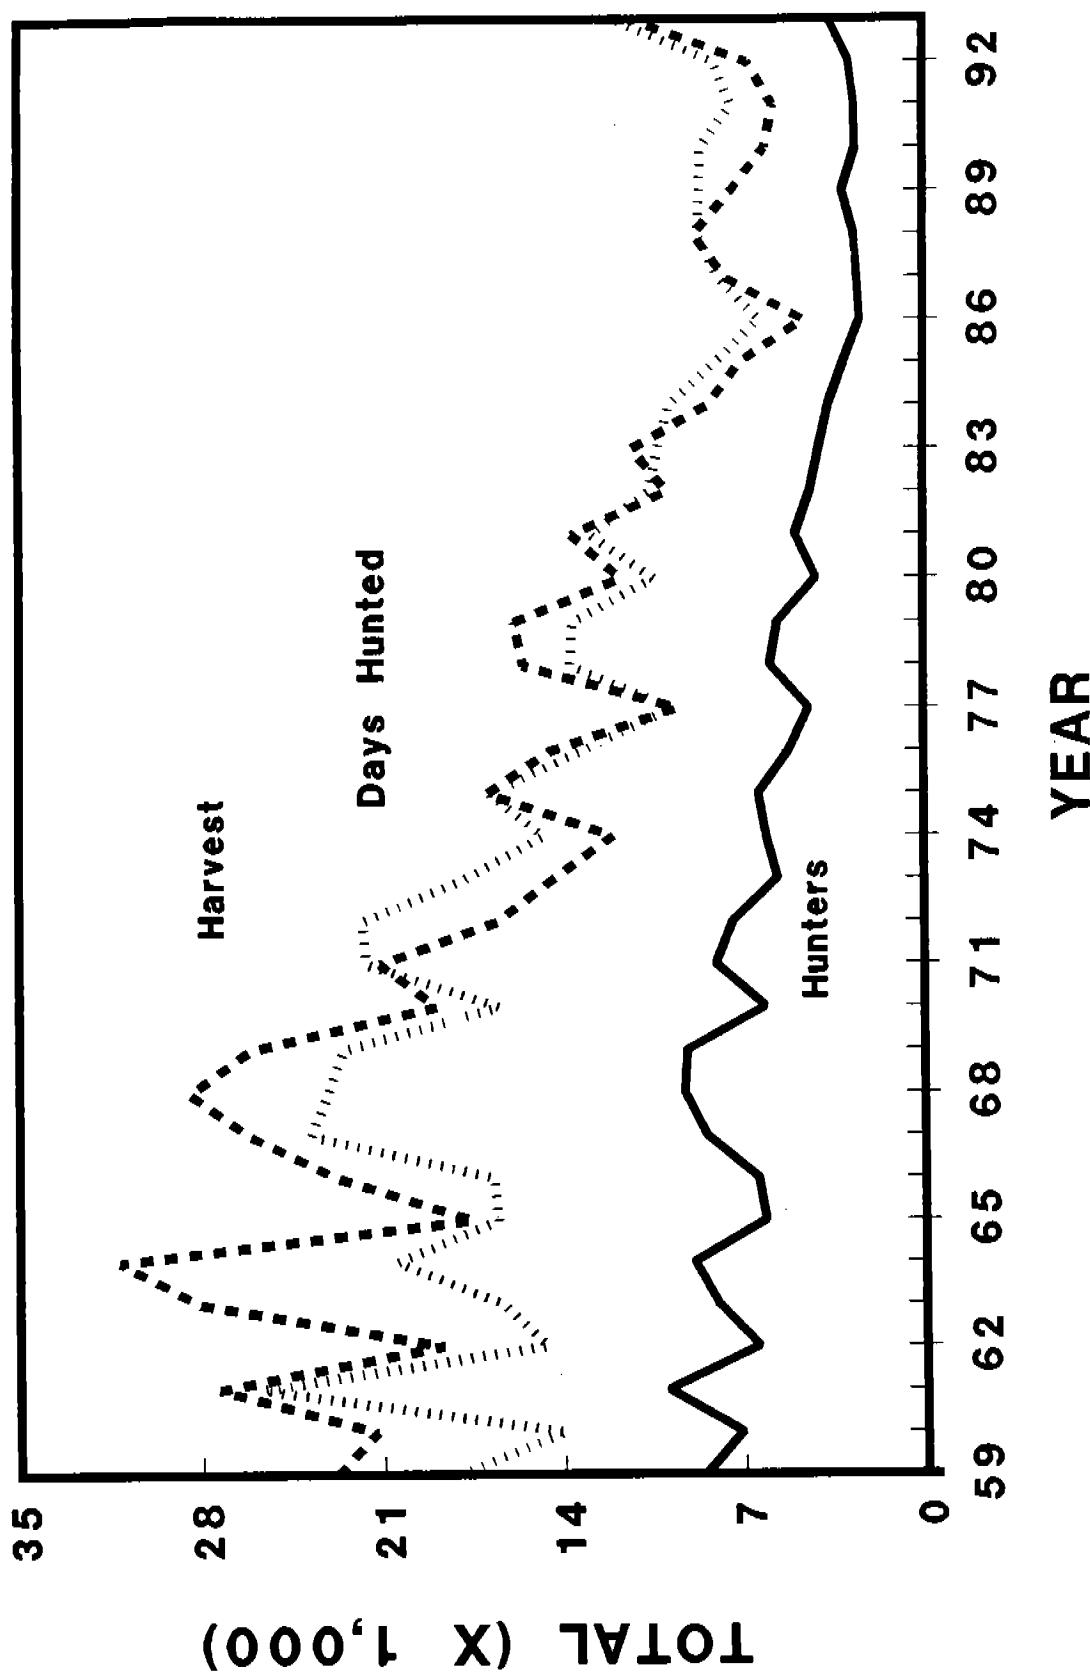

Figure 2. Statewide trends of quail harvest statistics, 1959-93.

### Brood Counts

Results of the annual random brood counts for California quail for 1993 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and quail observed per 100 hours are shown in Tables 2-4 and Figure 1. Gambel's quail and long period waterhole count trends are in Table 10. Survey results for 1993 compared to 1992 and the previous 10-year (1983-92) average follow:

		<u>Percent change from 1992</u>	<u>Average</u>
Total quail observed	719	+885	+168
Young per 100 adults	299	-35	-13
Mean brood size	6.07	-19	-20
Quail observed per 100 hours	5,531	+127	+423
Total hours effort	18	+500	-48

Brood count effort increased 500 percent in 1993. Seven hundred and nineteen quail were observed in 1993 which was 168 percent above average. Total hours of effort on California quail brood counts was 13 which is 48 percent below average for the last 10 years. The production index of young per 100 adults for Gambel's quail was 9 percent lower than what it was the previous year. Production statewide decreased to 13 percent below the long-term average.

### Harvest

Results of the annual hunter questionnaire for 1993 are shown in Table 5. Long-term trends of quail bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8, and total statewide harvest statistics in Table 9.

Comparison of the 1993 season to 1992 and the previous 34-year average follow:

		<u>Percent change from 1992</u>	<u>Average</u>
Quail hunters	3,649	+28	-33
Quail harvested	11,192	+65	-24
Hunter-days afield	11,952	+48	-12
Quail per hunter-day	0.94	+12	-11
Quail per hunter	3.07	+30	+17

Quail hunters increased 28 percent from 1992, but remain 33 percent below the long-term average. Quail harvest increased 65 percent from 1992.

Harvest for 1993 increased 28 percent from 1992 and was 33 percent below average. Long-term quail harvest statistics are shown in Figures 2 and 3.

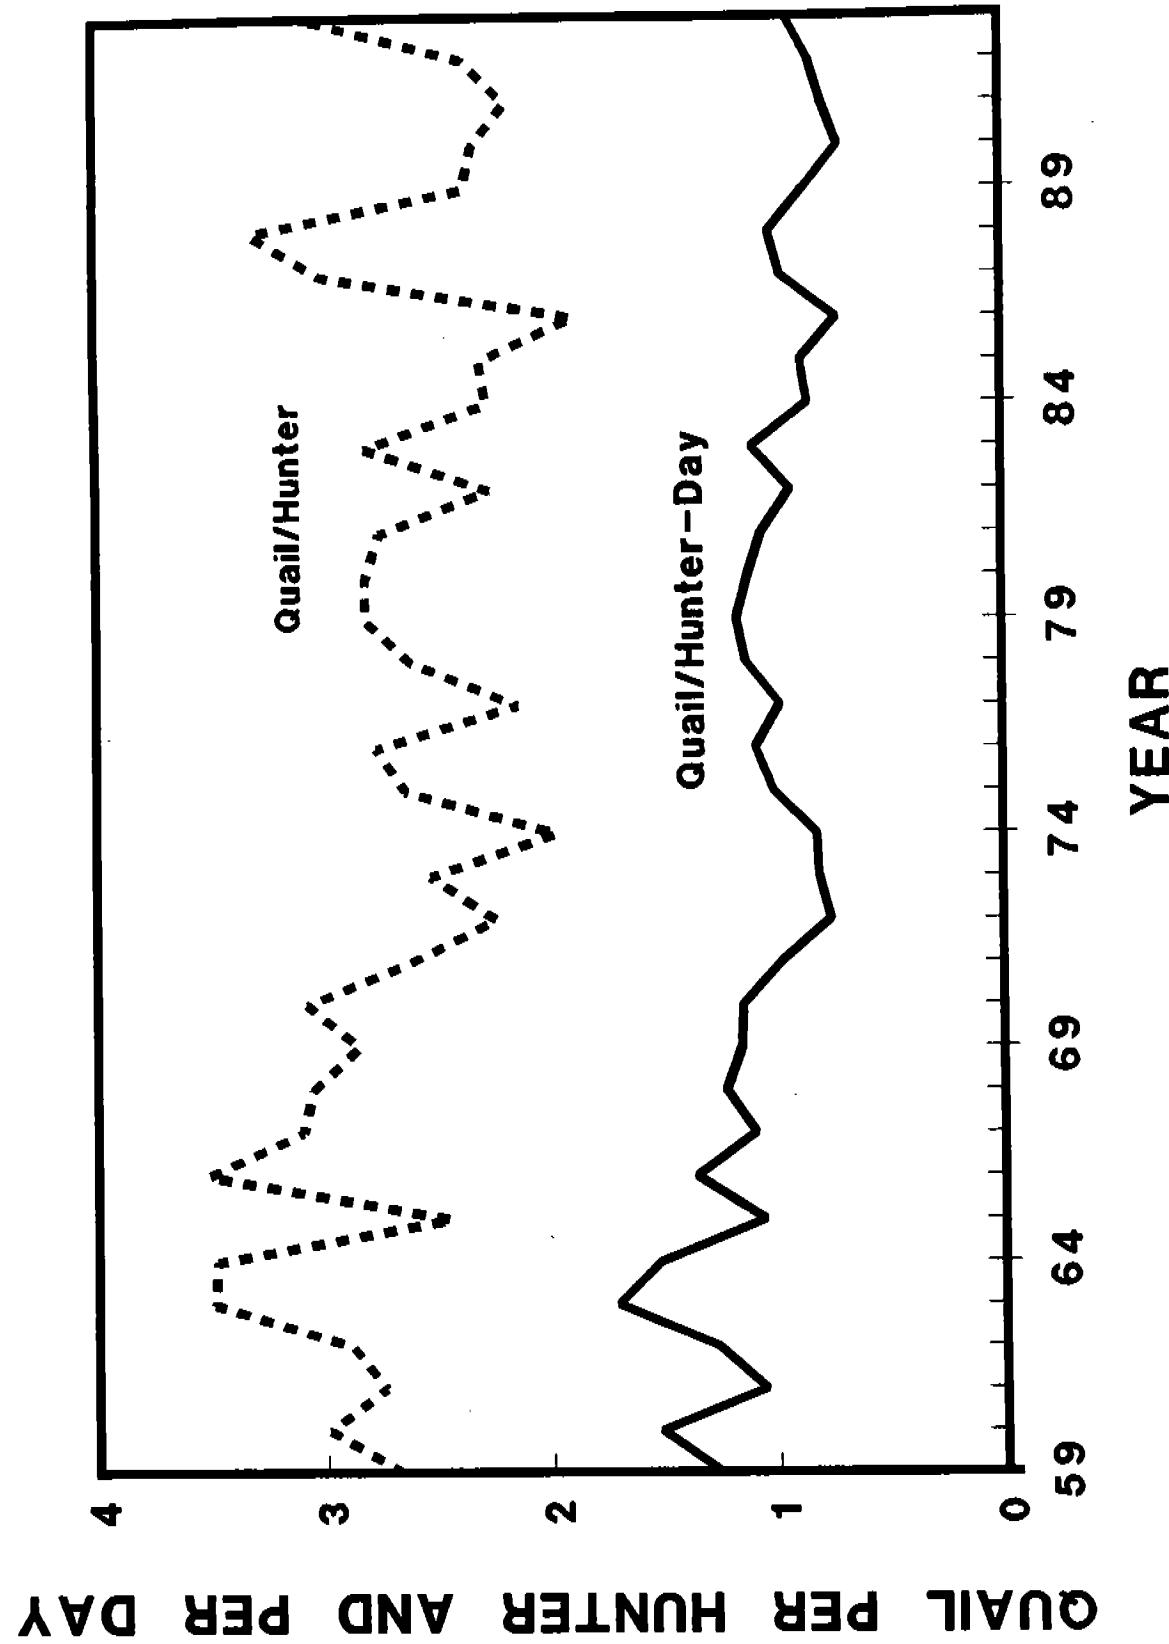

Figure 3. Statewide trends of quail hunter success rates, 1959-93.

# HUNGARIAN PARTRIDGE

## SUMMARY

In 1993, limited brood data was collected in Uintah County.

The 1993 hunt data indicated decreased hunting pressure on Huns when compared to 1992. The number of Huns harvested decreased 70 percent in 1993. Hunters afield decreased 35 percent. Total hunters, days afield and harvest remain just below the long-term average.

We expected continued improvement in Hungarian partridge populations in Box Elder County due to the large quantity of agricultural land set aside in the Conservation Reserve Program. We believe that increases in hunter success since 1985 reflect increased partridge populations as a direct result of CRP. Exceptions (declines) in 1988 and 1989 were probably due to drought. In 1993, the dramatic decrease in number of Huns harvested probably resulted because of poor over-winter survival during 1992-93.

### Brood Counts

Results of the annual random brood counts for 1993 are shown in Table 1 of this section. Long-term trends of young per adult ratios, mean brood size and Huns observed per 100 hours are shown in Tables 2-4. Results of the survey for 1993 compared to 1992 and the previous 10-year (1983-92) average follow:

		<u>Percent change from 1992</u>	<u>Average</u>
	<u>1993</u>		
Total Huns observed	17	-83	-81
Young per 100 adults	750	+32	+53
Mean brood size	15.00	+70	+50
Huns observed per 100 hours	40	-66	-84
Total hours effort	42	-51	-11

Young per 100 adults increased 32 percent from the previous year, and was 53 percent above average. Hours of effort decreased 51 percent from 1992, and only 1 brood was observed.

### Harvest

#### Hunter Questionnaire

Results of the annual hunter questionnaire for 1993 are shown in Table 5. Long-term trends of Huns bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. The 1993 season compared to 1992 and the previous 34-year average follow:

		<u>Percent change from 1992</u>	<u>Average</u>
	<u>1993</u>		
Hungarian partridge hunters	2,090	-35	-41
Hungarian partridge harvest	2,280	-70	-70
Hunter-days afield	6,194	-24	-30
Huns per hunter-day	0.37	-60	-55
Huns per hunter	1.09	-54	-47

Hungarian partridge hunters and hunting pressure decreased in 1993. Success decreased 70 percent from 1992. Harvest was 70 percent below the long-term average.

Long-term Hun harvest statistics are shown in Figures 1 and 2.

Field Bag Checks

No Hungarian partridge field bag check data was collected in 1993 (Table 10). Hunter success trends determined via this method are shown in Table 11.

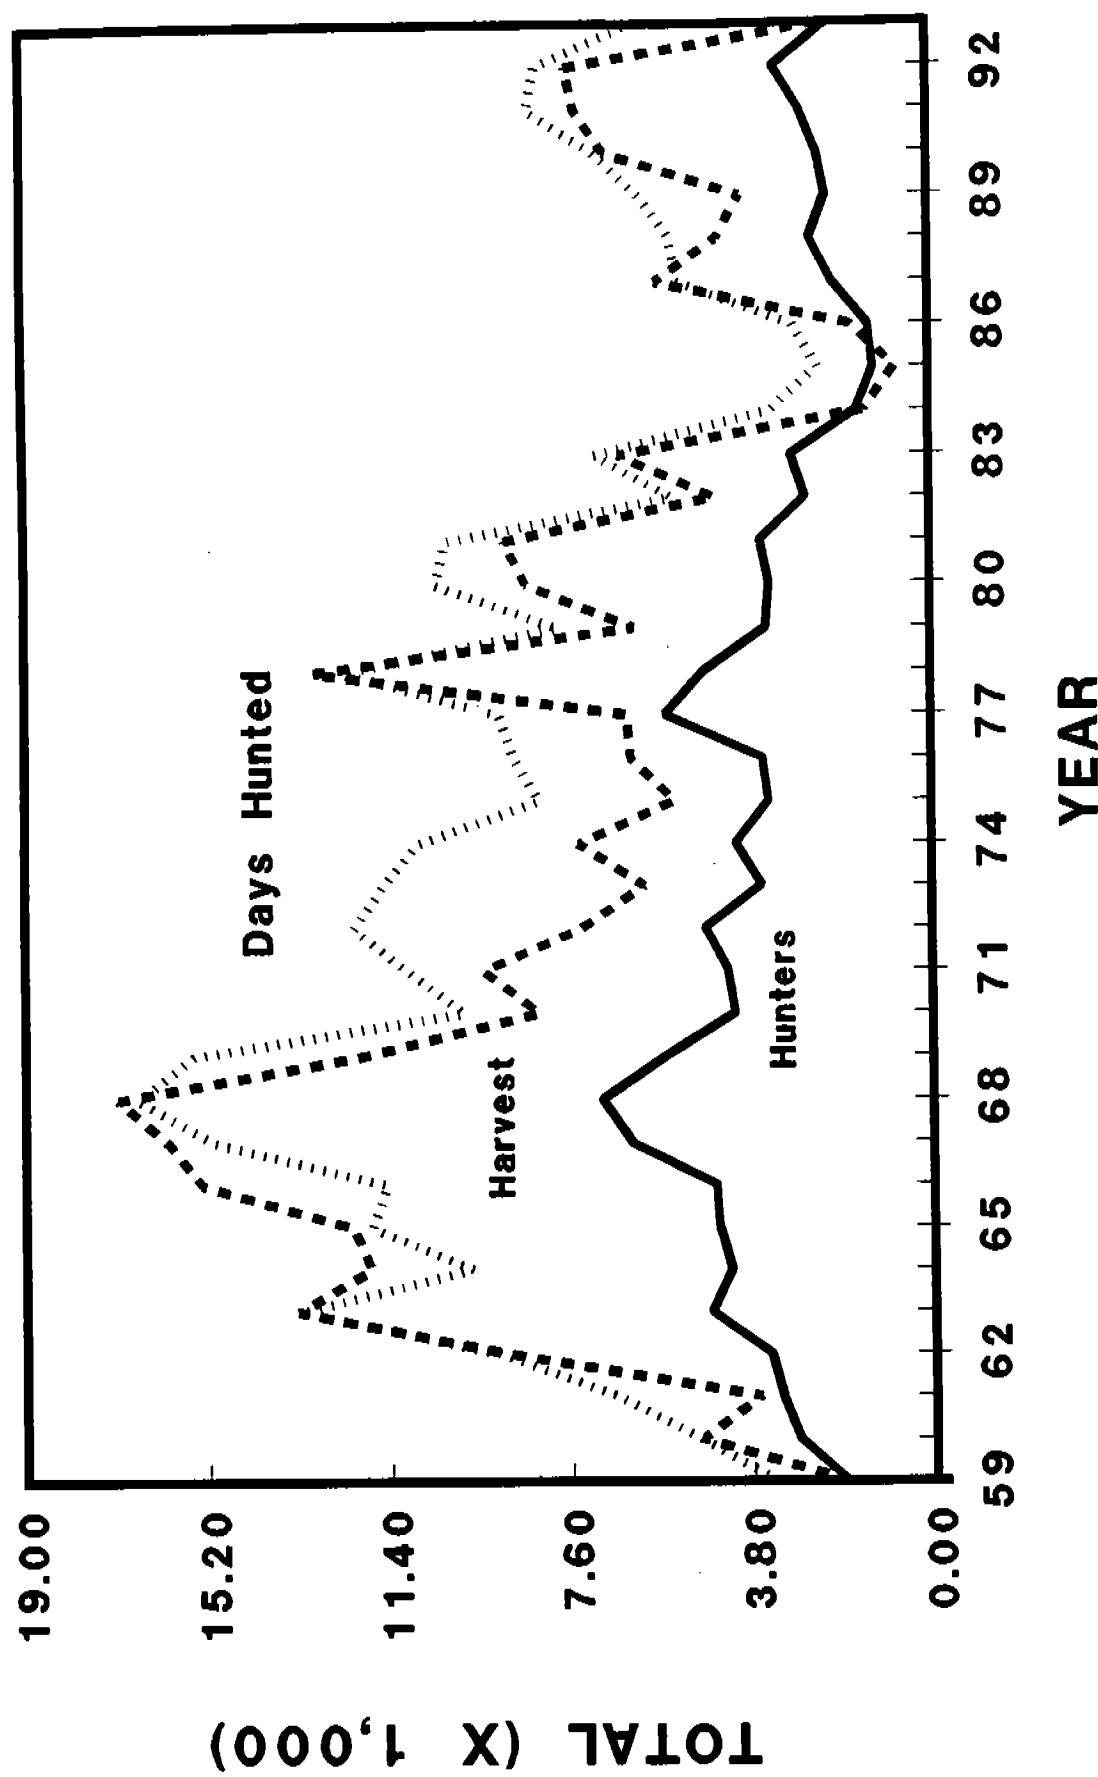

Figure 1. Statewide trends of Hungarian partridge harvest statistics, 1959-93.

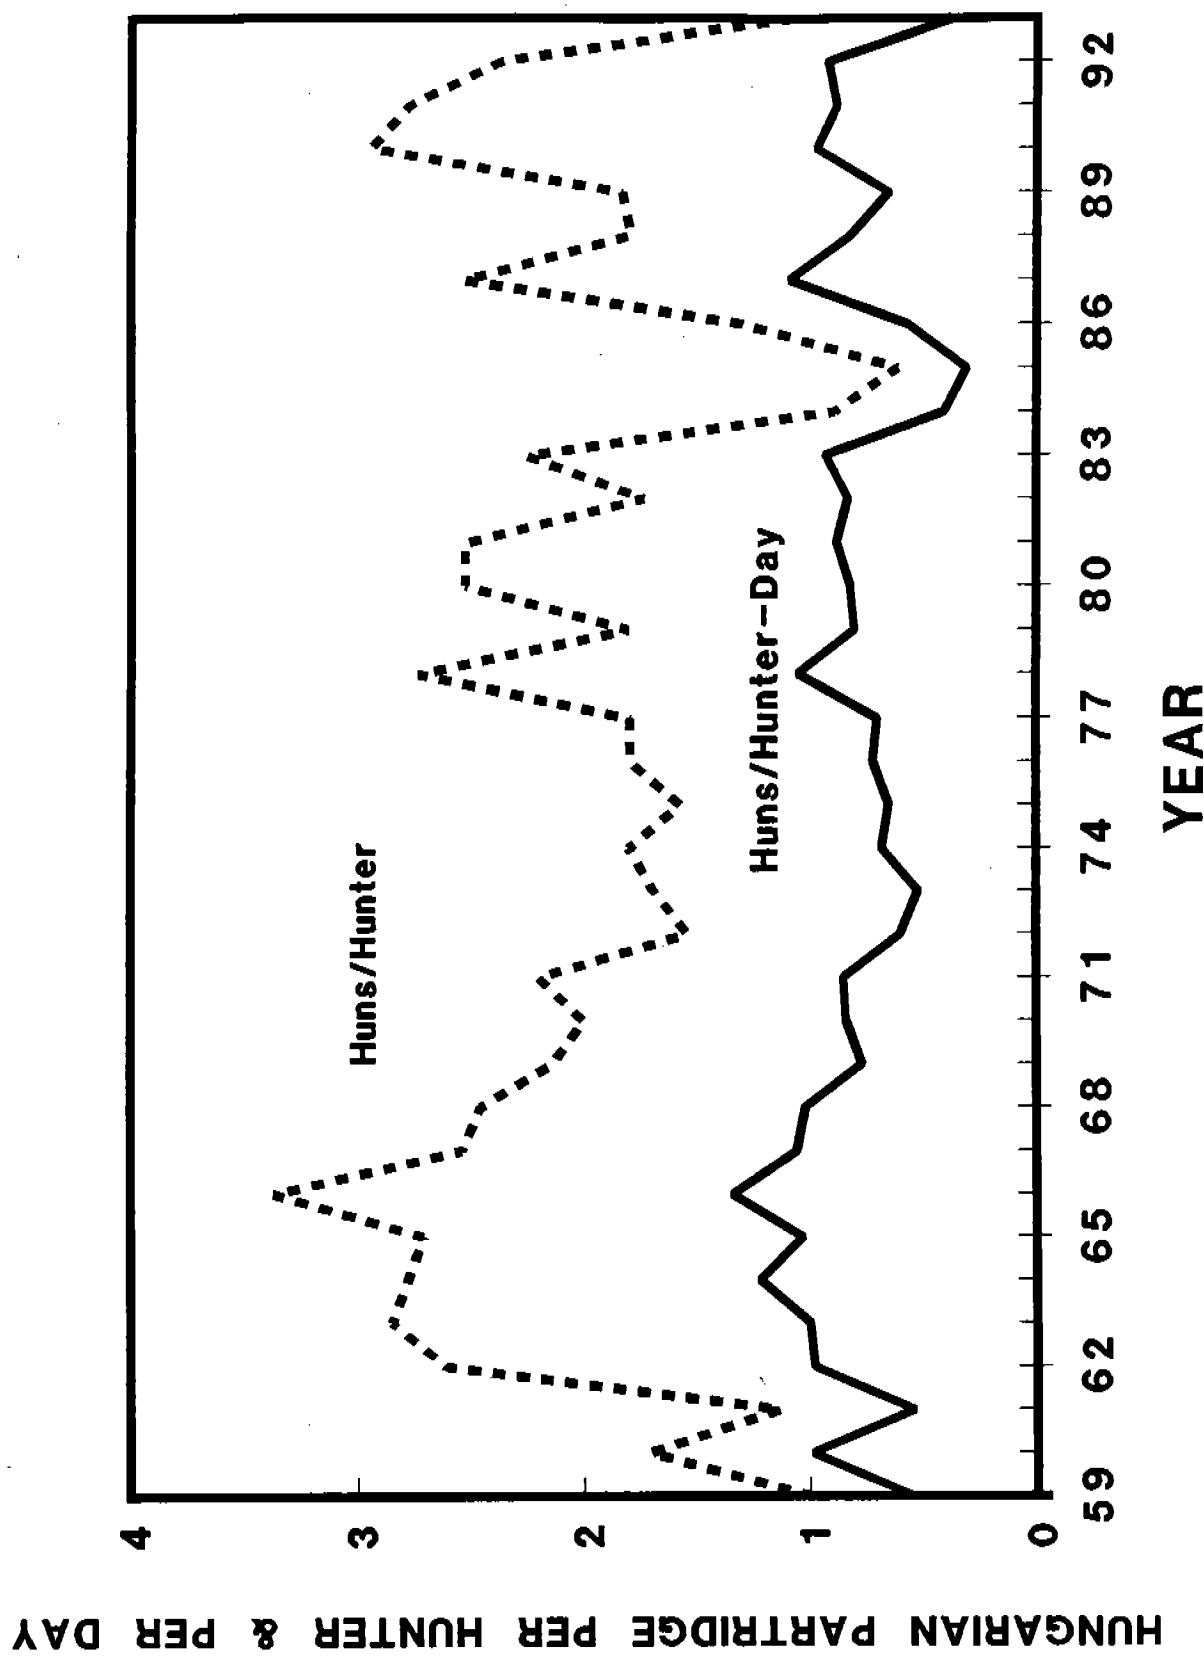

Figure 2. Statewide trends of Hungarian partridge hunter success rates, 1959-93.

# WILD TURKEY

## Merriam's Turkeys

## SUMMARY

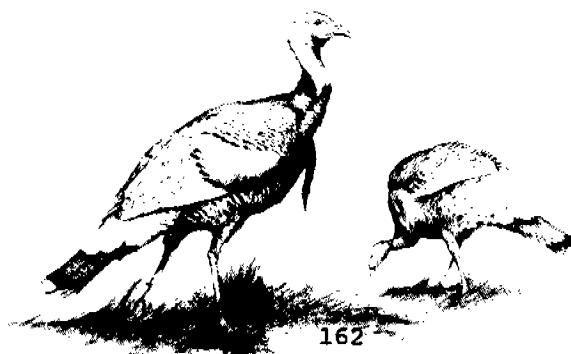

Turkey populations remain stable and above the 24-year average. The percent of hunters observing turkeys increased 20 percent in 1993 and remains 30 percent above average.

Hunter success and turkey observation data for the 1993 spring season indicated that the Boulder and East Zion areas had a better year than 1992. Total harvest and percent success increased 40 and 45 percent respectively. The remaining units of the state, including the LaSal Mountains were closed to hunting. A fall turkey hunting season was not held anywhere in 1993.

Spring hunting pressure was down 4 percent in 1993, but was well above average. Despite one of the worst winters in almost a decade, hunter success rates increased by 45 percent. Four percent fewer hunters were afield. A total of 74 turkeys were harvested in the spring hunt of 1993 compared to 53 taken in 1992, 59 in 1991 and 52 in 1990.

## Rio Grande Turkeys

In 1993, Utah sportsmen were again given a limited entry opportunity to harvest Rio Grande turkeys. Four units were designated as limited entry for Rio Grande turkeys: 1) Beaver, 2) New Harmony, 3) Pine Valley and 4) Weber. Five permits were available for each unit, except Beaver where 20 permits were available and New Harmony where 10 permits were issued. A \$25.00 permit was fee required to participate in the limited entry hunt. Hunters were allowed to harvest 1 male bird. Six hundred thirty-one sportsmen applied for the 40 available permits. A random drawing was held to determine successful applicants. Odds for drawing in each area were as follows: 1) Beaver 1:11, 2) New Harmony 1:12, 3) Pine Valley 1:9 and 4) Weber 1:50.

A Rio Grande wild turkey-bid permit was available again. Minimum bid on the permit was \$350 January 15th through 8:00 p.m. March 6th, 1993. Two bids were submitted by the 8:00 p.m. deadline on March 6th. Because of wording errors in the 1992-93 Upland Game Proclamation, both bids were accepted and 2 permits issued. One bid was for \$405.00 and the other for \$425.00. The successful bidders had their choice of the limited entry units to hunt and chose to hunt the New Harmony Unit.

Limited brood count data is exhibited in Table 5. Harvest statistics for the limited entry hunts are found in Table 6. Forty-two hunters averaged 4.88 days-afield each to harvest a total of 26 turkeys. Five of the harvested birds were yearlings and 21 were adults. Sixty-three percent of the hunters afield harvested a bird.

As other Rio Grande populations continue to grow throughout the state, more limited entry opportunities will be provided.

## Harvest

### Spring Merriam's Gobbler Season

Results of the 1993 spring season are shown in Table 1 of this section. The trend of these data since 1968 is shown in Table 2 and Figures 1 and 2. Specific harvest information is listed in Table 3. Statewide summary of fall hunt statistics is in Table 4. The 1993 spring season compared to 1992 and the previous 24-year average follow:

		<u>Percent change from</u>	
	<u>1993</u>	<u>1992</u>	<u>Average</u>
Permits sold	500	-7	+95
Hunters afield	466	-4	+101
Turkeys harvested	74	+40	+169
Hunter-days afield	1,508	-6	+120
Percent hunter success	16	+45	+42
Turkeys bagged per hunter-day	0.05	+67	+18
Percent of hunters who observed turkeys	54	+20	+30

Permit sales and hunters afield decreased slightly from 1992 but were well above average. Total harvest increased (from 53 in 1992 to 74 in 1993), which is forty percent above the previous year. Hunter success rates increased 45 percent from 1992 and were 4 percent below the 24-year average. The proportion of hunters who reported having observed turkeys was 30 percent above average. In 1993, the Boulder Unit accounted for 59% of the hunting pressure based on hunter-days afield. The East Zion unit accounted for 41% of the hunting pressure. However, the East Zion Unit accounted for 63% of the statewide harvest.

The trend of spring Merriam's turkey harvest statistics is shown in Figures 1 and 2. Five percent of the hunters used archery equipment, one hunter used a rifle and the remainder reported using shotguns. Five turkeys were reported crippled and not recovered. One of 54 known kills was suspected of being female and another 17 are suspected of being jakes.

Thirty-one percent of the harvest (9) occurred on opening day (Friday), 14 percent the following day, 45 percent the first weekend and 7 percent the last weekend of the hunt. Sixty-six percent of the harvest occurred on weekends compared with 48 percent last year (1992), 14 percent in 1991 and 22 percent in 1990.

# **SHARP-TAILED GROUSE**

## **SUMMARY**

The Columbian sharp-tailed grouse is one of four species of grouse native to Utah. Sharp-tails were formerly abundant in the valley and foothill areas of northern and central Utah. Sharp-tailed grouse habitats were the most attractive areas for agricultural development and grazing. As a result, sharp-tail habitat was directly converted to farmland or was seriously impacted by heavy grazing.

There was no legal harvest of sharp-tailed grouse from 1980 through 1993. Since 1988, the number of birds present on active dancing grounds has been substantially greater than in recent years (Table 1.). It appears sharp-tailed grouse have made a moderate recovery in core areas. Numbers on the fringe of their range appear to be low. Concurrent with the upswing in sharp-tailed populations has been a succession of mild winters. Since the catastrophic winter of 1983-84, all winters have been normal or milder than normal except 1988-89 and 1992-93.

In Box Elder County, habitat associated with existing populations of sharp-tailed grouse has been relatively unchanged since 1983 except that about 100,000 acres in Box Elder County have been entered into the Conservation Reserve Program (CRP). This may be benefitting sharp-tailed grouse populations by providing undisturbed nesting and brood-rearing cover. The value of CRP to wildlife in Utah is being studied.

We have minimal recent data on sharp-tailed grouse populations in the Cache, Weber, and Morgan County areas. By 1984, populations in these areas were at or below minimum viable population levels. Efforts have increased over the past three years to locate "new" dancing grounds in these counties (Table 1.). New "core" sharp-tailed grouse habitat areas are being attributed to CRP lands in these counties.

Sharp-tailed grouse brood count information for Box Elder County in 1993 is shown in Table 2.

\*High sagebrush precluded an accurate count--birds were counted when flushed.

Since visitation by females at any given time is low, an estimated 90% of the grouse seen on the ground are males.

Therefore, this figure is an estimate of the males on the ground.

# PTARMIGAN

## SUMMARY

The white-tailed ptarmigan (*Lagopus leucurus*) was introduced into the Uinta Mountains of northeastern Utah in 1976 with the release of birds captured in Colorado. The initial transplant consisted of 22 paired birds released in June 1976. A second release of 35 mixed young and adults was accomplished in September of that same year.

### Breeding Territory and Brood Surveys

Surveys on the ptarmigan population continue, as time and manpower constraints allow. Two survey techniques are used. A breeding territory survey is conducted from mid- to late June. A brood survey is conducted from mid- to late August. Results of the last 10 and 11 years of survey data are found in Tables 1 and 2.

No spring survey of breeding territories and no summer brood survey was made in 1993.

### Harvest

Ten hunters bought \$3.00 permits to hunt ptarmigan in Utah in 1993 (Table 3). An estimated 10 hunters actually pursued ptarmigan and no birds were killed. Thirty-eight percent of the hunters afield reported observing ptarmigan.

Many permits are obtained by sportsmen who think they might hunt during a fishing or big game hunting trip, but don't seriously plan on the ptarmigan hunt.

PTARMIGAN

**Table 1. Summary of white-tailed ptarmigan breeding territories (pairs), 1983-93.**

\*\*For the first time a handling fee of \$2.00 per permit was charged.  
Projection Factor = 1.11 (10 permits issued/9 questionnaires returned).

# RABBITS AND HARES

## SUMMARY

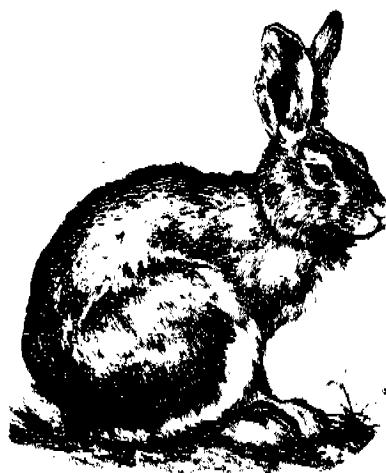

### Cottontail Rabbits

Cottontail populations remain below a short term high in 1988.

Summer roadside counts indicated a decreased population density statewide. Harvest statistics indicated decreased hunter success and is still 59 percent below average.

### Snowshoe Hares

Hunter numbers decreased 26 percent from the previous year and remained below average. Although efforts have been made to educate hunters in the identification of the snowshoe hare and the white-tailed jackrabbit, it is still a potential problem which could bias the snowshoe data.

## COTTONTAIL RABBIT

### Roadside Counts

Results of the annual roadside counts for 1993 are shown in Table 1 and Figure 1. The long-term trend of cottontails observed per mile and young per 100 adults is shown in Figure 4 and Tables 2 and 3. Indices for 1993 compared to 1992 and the previous 10-year (1983-92) average follow:

	<u>1993</u>	<u>Percent change from 1992</u>	<u>Average</u>
Total miles driven	750	-12	-40
Total cottontails counted	84	-59	-78
Cottontails observed per mile	0.11	-54	-64
Young observed per 100 adults	35	-51	-54

Production data from roadside counts indicated a decrease in the population. The cottontail per mile index decreased 54 percent and was 64 percent below the long-term average.

### Harvest

#### Hunter Questionnaire

Results of the 1993 hunter questionnaire are found in Table 4. Trends of cottontails bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 5-7. Trends of statewide harvest statistics are found in Table 8 and Figures 2 and 3. Results of the 1993 season compared to 1992 and the 26-year average follow:

	<u>1993</u>	<u>Percent change from 1992</u>	<u>Average</u>
Cottontail hunters	17,578	-14	-28
Cottontail harvest	64,400	-45	-59
Hunter-days afield	77,968	-6	-22
Cottontails per hunter-day	0.83	-41	-45
Cottontails per hunter	3.66	-36	-40

Total hunters decreased 14 percent from 1992. Total harvest decreased 45 percent. Total harvest was 59 percent below average. Hunter success was 45 percent below average. Harvest data indicate a year of below average populations of cottontails. Seven years of drought and the severe winter of 1992-93 have negatively affected rabbit populations statewide.

## SNOWSHOE HARE

### Harvest

Results of the 1993 hunter questionnaire are found in Table 11. Trends of snowshoe hares bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) are found in Tables 12-14. Trend in statewide harvest statistics by year are shown in Table 15 and Figures 1 and 2. The 1993 season compared to 1992 and the 18-year average follow:

	<u>1993</u>	<u>Percent change from 1992</u>	<u>Average</u>
Snowshoe hare hunters	2,755	-26	-45
Snowshoe hares harvested	4,237	-41	-59
Hunter-days afield	10,774	-9	-27
Snowshoes per hunter-day	0.39	-35	-39
Snowshoes per hunter	1.54	-19	-19

Significant misidentification of white-tailed jackrabbits as snowshoe hares was anticipated prior to mailing the harvest questionnaire following the first season in 1975. This proved to be the case as a significant harvest of snowshoe hares was reported for counties outside the known range of the species. It was assumed that the problem was statewide, not just confined to those counties. Several attempts were made in the 1970's to reduce misidentification through pictures and descriptions in leaflets and questionnaires.

Beginning in 1988, harvest questionnaires, and in 1989 the Upland Game Proclamation had drawings and descriptions of the various rabbits in an attempt to reduce misidentification. We believe this has been successful.

Results of the 1993 harvest questionnaire indicates a 35 percent decrease in hunter success compared to 1992. Success was below the long-term average.

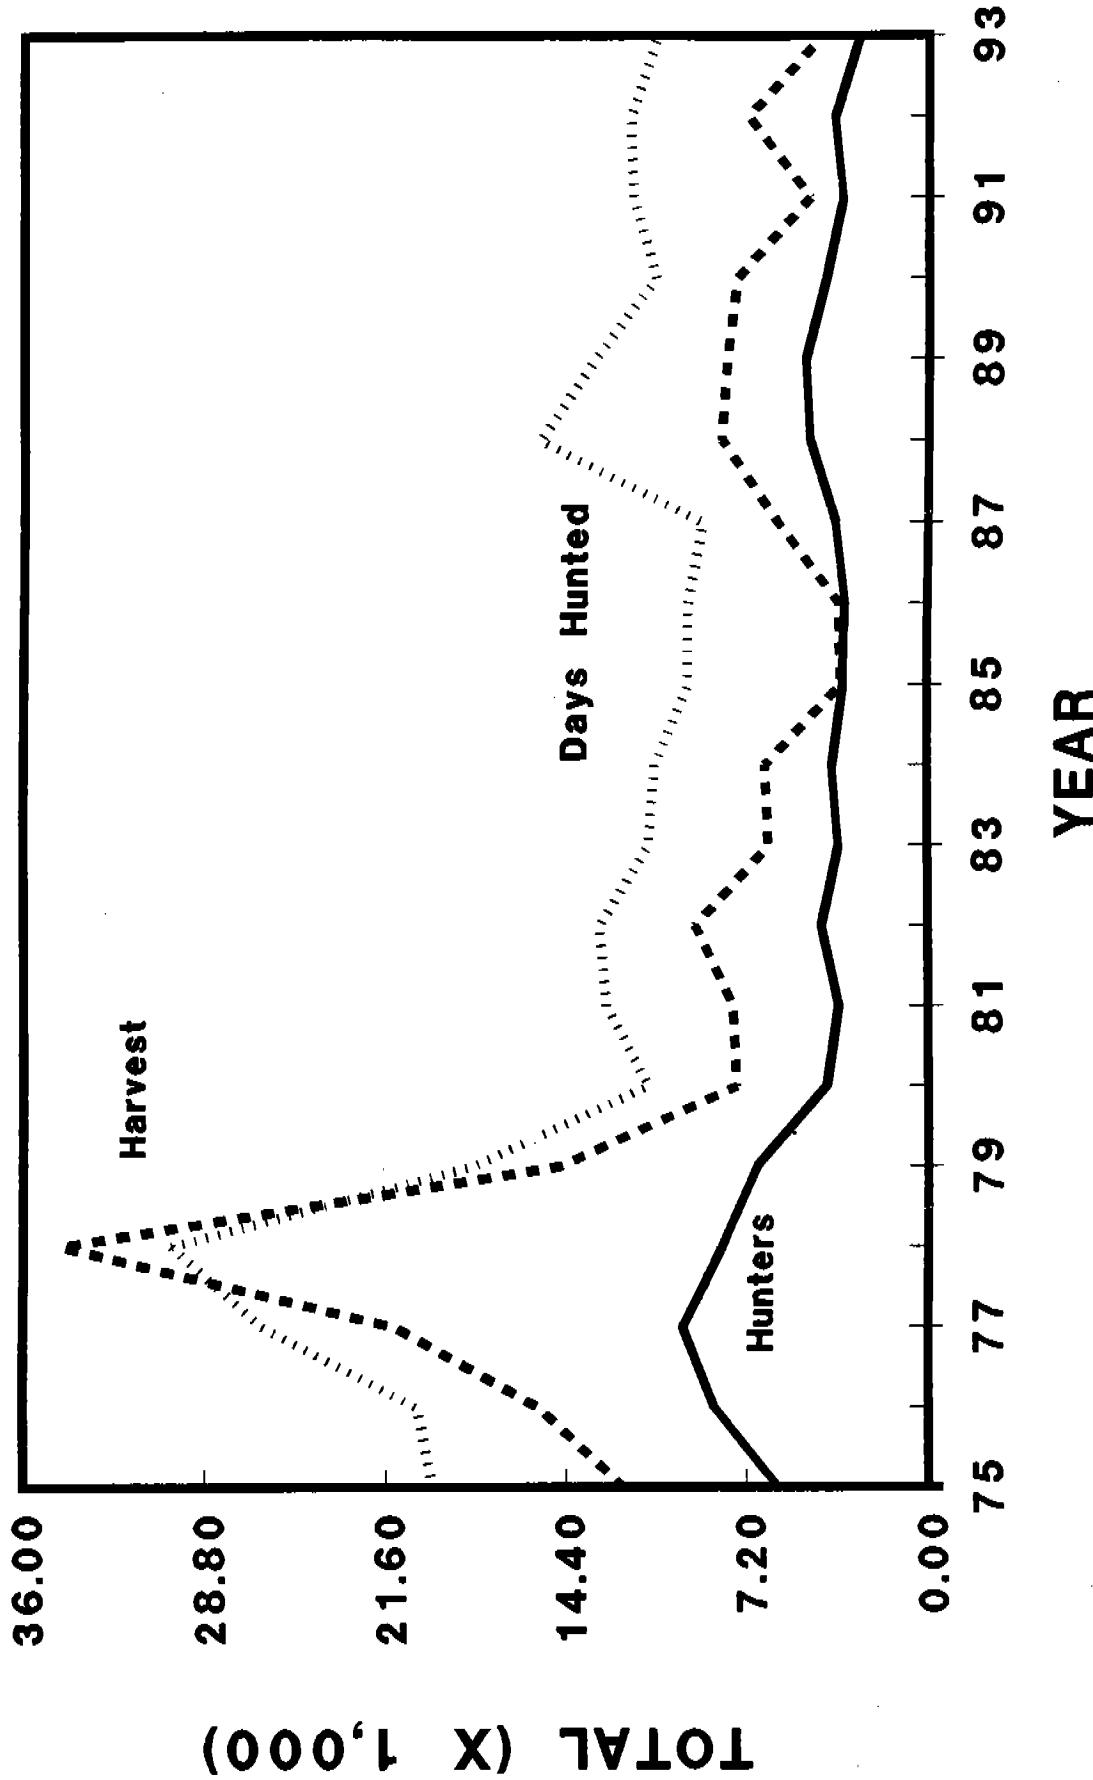

Figure 1. Statewide trends of snowshoe hare harvest statistics, 1975-93.

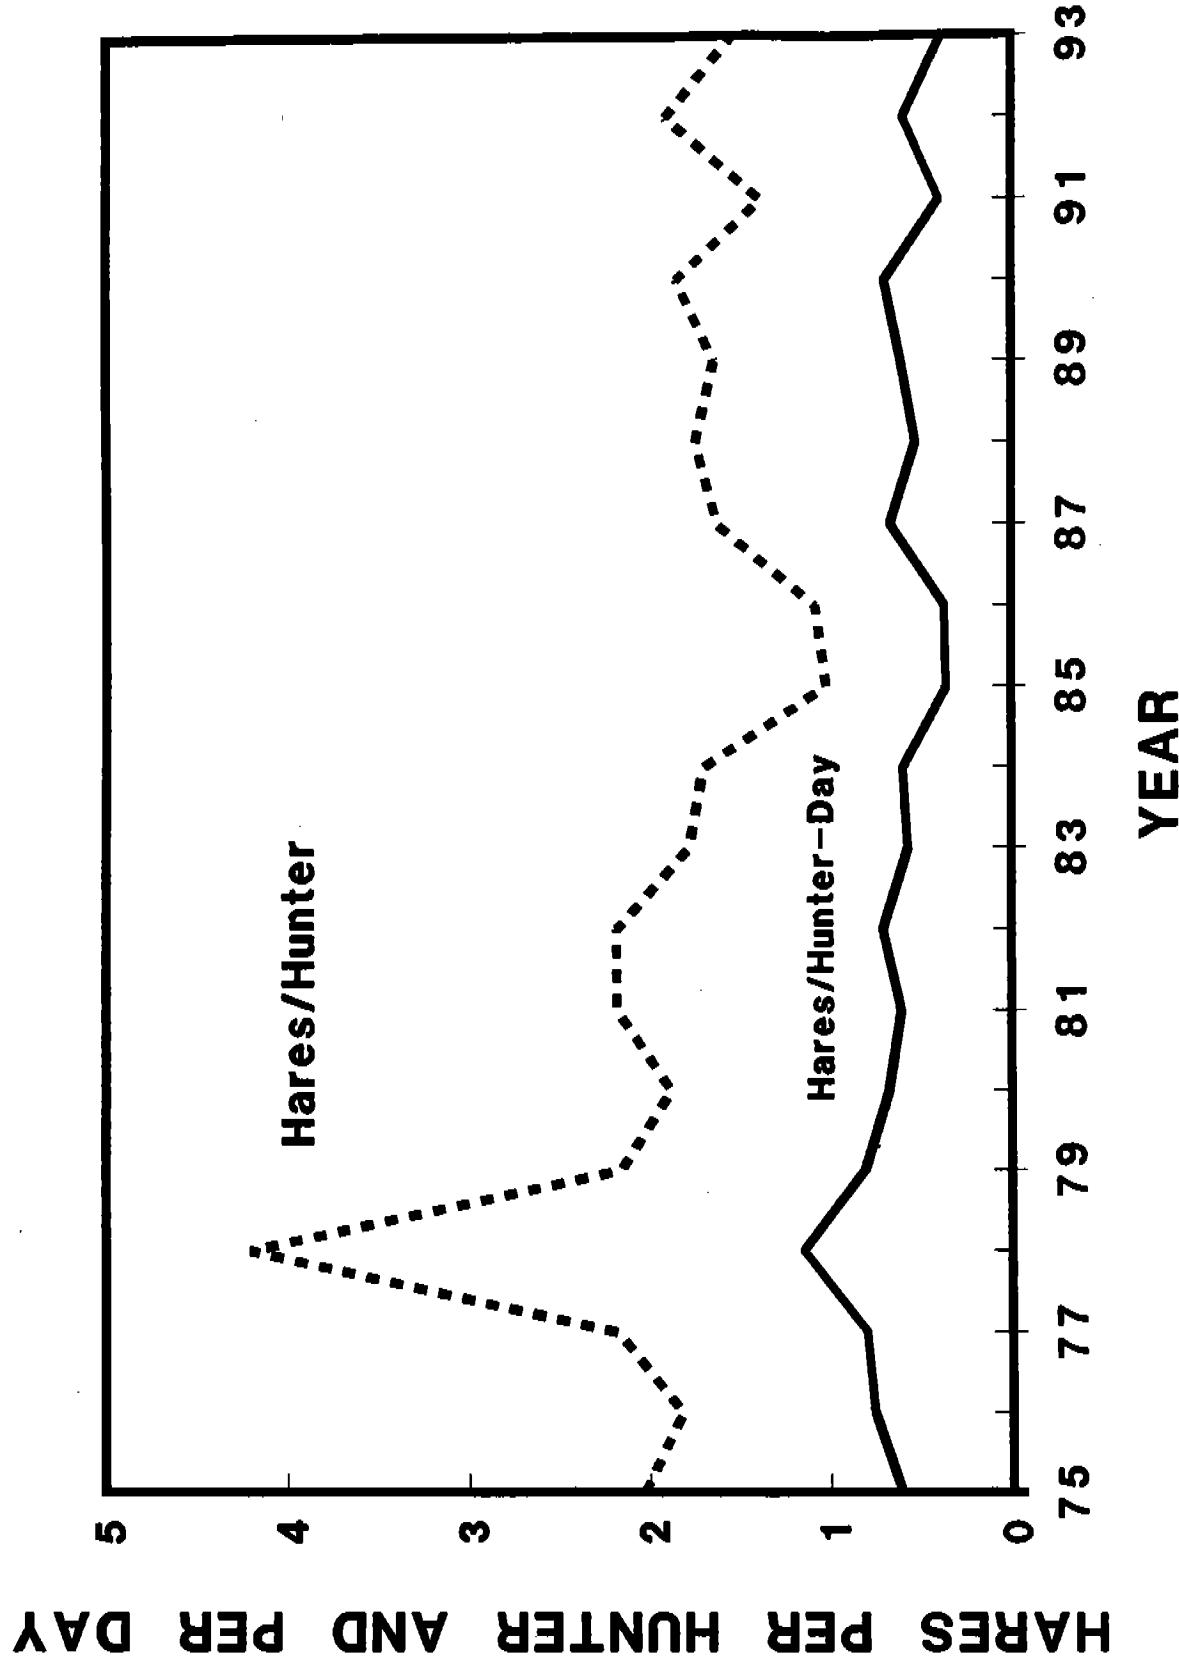

Figure 2. Statewide trends of snowshoe hare hunter success rates, 1975-93.

## APPENDIX A

### WEATHER CONDITIONS

Weather information used in this report (Tables 1 & 2 and Figures 1 & 2) is from the office of the Utah State Climatologist and N.O.A.A. Climatological Data Periodical.

The 1992-93 winter weather was severe in terms of precipitation and in terms of cold temperature. Above average precipitation fell between December 1992 and March 1993. November 1992 through February 1993 temperatures were below average. Cold temperatures and deep, continuous snowpack persisted through the winter.

In the spring of 1993, March, May and June precipitation was above normal. Temperatures were above normal through March, April and May.

Precipitation continued to be somewhat normal between July and August and dropped below normal in September, November and December. Temperatures remained below normal between June and November.

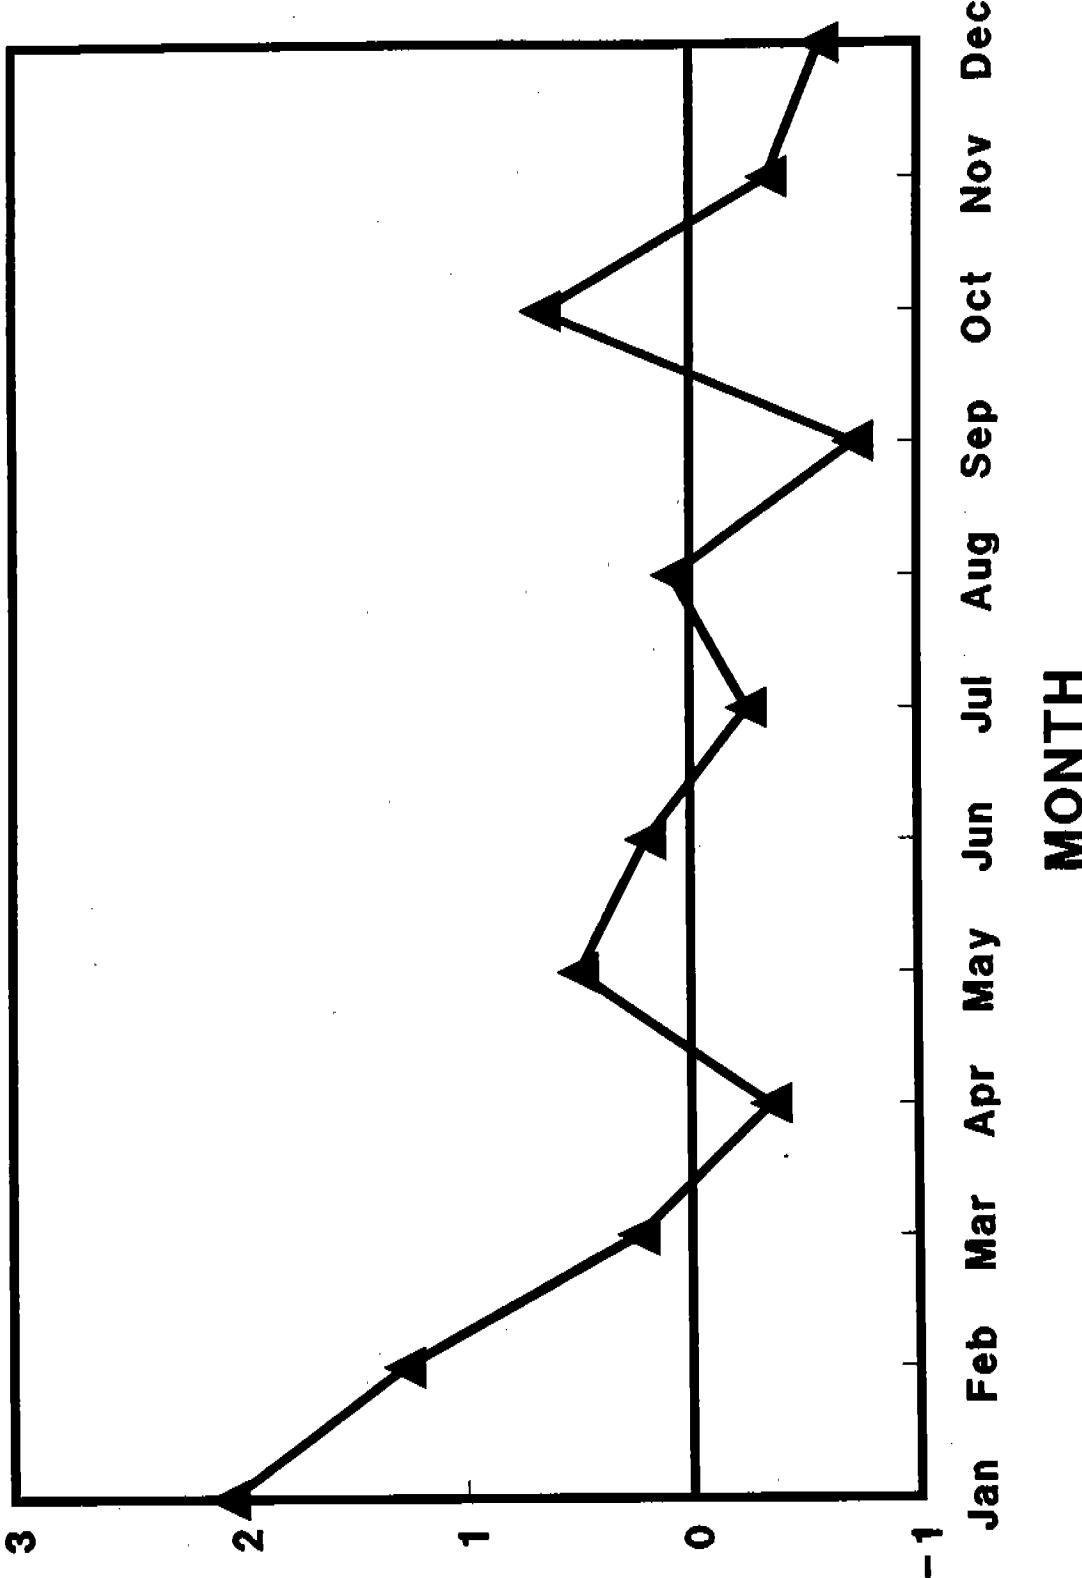

Figure 2. Monthly average precipitation departure from normal (inches), 1993.

APPENDIX B

LICENSE SALES

Small game license sales by type and cost are listed in Table 1. The number of licenses sold for all types decreased slightly in 1993.

The proportion of Utah's population hunting small game is declining (Table 2). In the early 1970's about 10 percent of Utah's population was hunting small game. In 1993, only 4.7 percent of Utah's population hunted small game.

Table 3 identifies revenue generated to the Utah Division of Wildlife Resources from small game license sales. Small game program budgets run about half the revenue generated, with the other half going to support services such as law enforcement, administration, accounting, and field services.

Table 1. Statewide small game license sales information, 1954-93.

Year	Adult Res.		Juv. Res.		Non Res.

<sup>1</sup> Value does not include cougar, bear, band-tailed pigeon and wild turkey permits, Upland Game Habitat Stamp fees or commercial hunting area licenses. It does not include NRSG revenue--this is assumed to be primarily non-resident bear and cougar hunters.

<sup>2</sup> Combination license values are based on the assumption that all waterfowl hunters purchased only combination licenses.

They may fish and hunt big game but they do not hunt any other small game. Therefore, duck stamp sales are subtracted from combination license sales when projecting revenue generated. The proportion of the combination license fee attributed to small game equals the resident small game license fee divided by the resident fishing license, plus the resident big game license fee, plus the resident small game license fee or \$9.33 for 1993.

<sup>3</sup> Total Federal duck stamps sold does not include those sold during the second quarter, April-June, because persons purchasing stamps during this quarter tend not to be hunters.

<sup>4</sup> Half of the juvenile small game license sales were attributed to waterfowl hunters. Federal duck stamps are not required of juveniles less than 16 years of age.

APPENDIX C: Regional and statewide summary of effort expended on upland game summer surveys, 1971-93.

Generally hours spent and miles driven on upland game surveys in Utah have declined since 1971. This is the result of competing uses of time for biologists and conservation officers. In addition, the restriction to a 40 hour work week by the Federal Fair Labor and Standards Act has further eroded survey effort. When effort and results have reached a lower critical sample size, surveys have been eliminated.

Table 1. Regional and statewide summary of effort expended on upland game summer inventory, 1971-93.

APPENDIX D: Season dates, bag limits and areas open by upland game species, 1993.

<u>Species</u>	<u>Season Dates</u>	Daily Bag Limit	Possession Limit	<u>Areas Open</u>
Pheasant	Nov. 6-Nov. 21	2 cocks	4 cocks	Statewide.
	Nov. 6-Dec. 6	2 cocks	4 cocks	All state and federal lands (including private lands leased by the Division subject to restrictions and closures imposed by administering agencies) in Carbon, Duchesne, Emery, Grand, Juab, Millard, San Juan, Sanpete, Sevier, Tooele and Uintah counties. The South Fairfield Posted Hunting Unit as posted and marked.
Mourning Dove	Sept. 1-30	10	20	Statewide (except lands closed under CLOSED AREAS).
Band-Tailed Pigeon	Sept. 1-30	5	10	Beaver, Garfield, Grand, Iron, Kane, Millard, Piute, San Juan, Sanpete, Sevier, Utah, Washington and Wayne counties.
Chukar	Sept. 11-Nov. 30	5	10	Cache, Daggett, Morgan, Rich, Sanpete and Weber counties; Davis County except Antelope Island; those parts of Box Elder, Juab, Millard, Salt Lake, and Utah counties east of I-15; that part of Sevier County north of I-70; and all of Summit County except the Henefer-Echo Wildlife Management Area as posted and marked.
	Sept. 11, 1993- Jan. 31, 1994	5	10	Beaver, Carbon, Emery, Garfield, Grand, Iron, Kane, Piute, San Juan, Tooele, Uintah, Washington and Wayne counties; those parts of Box Elder, Juab, Millard, Salt Lake, and Utah counties lying west of I-15; that part of Sevier County south of I-70.
Sage Grouse	Sept. 11-19	2	4	Beaver, Carbon, Daggett, Grand, Iron, Kane, Piute, Rich and Uintah, and Wayne counties; that part of Sevier County south and west of I-70 and US-89; beginning near Soldier Summit at the Utah-Wasatch county line;

APPENDIX D (continued)

<u>Species</u>	<u>Season Dates</u>	<u>Daily Bag Limit</u>	<u>Possession Limit</u>	<u>Areas Open</u>
				then south and east along this county line to Reservation Ridge; east along this ridge to Argyle Creek; east along this creek to the Duchesne-Carbon county line; west along this county line to the drainage divide between the Spanish Fork and Price rivers; north along this drainage divide to the Utah-Wasatch county line near Soldier Summit; that part of Duchesne County north and east of the Duchesne River; that part of Box Elder County west of I-15.
Forest Grouse	Sept 11-Nov 30 (aggregate)	4 (aggregate)	8 (aggregate)	Statewide.
Quail	Nov. 6-Nov. 19	5	10	Beaver, Box Elder, Carbon, Daggett, Davis, Duchesne, Emery, Garfield, Grand, Iron, Juab, Kane, Millard, Piute, Salt Lake, San Juan, Sevier, Uintah, Utah, Wayne and Weber counties.
	Nov 6-Dec. 31	5	10	Washington County.
Hungarian Partridge	Sept 11-Nov 30	5	10	Cache, Davis, Morgan, Rich and Weber counties; those portions of Box Elder and Juab counties east of I-15; and all of Summit County except the Henefer-Echo Wildlife Management Area as posted and marked.
	Sept 11, 1993 Jan. 31, 1994	5	10	Tooele County; and that part of Box Elder and Juab counties west of I-15.
Wild Turkey Rio Grande Hunt #101	April 9- May 22, 1994	Season Limit 1 Male Turkey 5 Permits		Beaver - Boundary begins at the junction of I-70 and Highway SR-89; then southerly on SR-89 to the Garfield-Piute county line, then westerly along this county line to the Beaver-Iron county line, then westerly along this county line to I-15;

APPENDIX D (continued)

<u>Species</u>	<u>Season Dates</u>	Daily Bag Limit	Possession Limit	<u>Areas Open</u>
Hunt #102	April 9- May 22, 1994	Season Limit 1 Male Turkey 5 Permits		northerly on I-15 to I-70; easterly on I-70 to SR-89.
Hunt #103	April 9- May 22, 1994	Season Limit 1 Male Turkey 5 Permits		Duchesne-Uintah - All of Duchesne and Uintah counties.
Hunt #104	April 9- May 22, 1994	Season Limit 1 Male Turkey 5 Permits		Emery - All of Emery County.
Hunt #105	April 9- May 22, 1994	Season Limit 1 Male Turkey 5 Permits		Grand County - Boundary begins at the junction of I-70 and highway SR-128; then southerly on SR-128 to the Colorado River; then northerly on the Colorado River to the confluence of the Dolores River; then easterly on the Dolores River to the Utah-Colorado line; then northerly on this line to I-70; then westerly on I- 70 to SR-128.
Hunt #106	April 9- May 22, 1994	Season Limit 1 Male Turkey 5 Permits		Milford - Boundary begins at Milford, Utah; then northerly on SR-257 to Negro Mag Wash; then east on Negro Mag Wash to Cunningham Wash; then south on Cunningham Wash to Wildcat Creek; then south on Wildcat Creek to Indian Creek; then south on Indian Creek to SR-21; then west and north on SR- 21 to Milford.
Hunt #107	April 9- May 22, 1994	Season Limit 1 Male Turkey 25 Permits		Morgan-Summit - All of Morgan and Summit counties.
Hunt #108	April 9- May 22, 1994	Season Limit 1 Male Turkey 20 Permits		Pine Valley - Boundary begins at the junction of I-15 and SR-56; then westerly on SR-56 to SR- 18; then southerly on SR- 18 to I-15; then northerly on I-15 to SR-56.
Hunt #109	April 9- May 22, 1994	Season Limit 1 Male Turkey 5 Permits		Utah County - All of Utah County.
				Weber County - All of Weber County.

## APPENDIX D (continued)

<u>Species</u>	<u>Season Dates</u>	<u>Daily Bag Limit</u>	<u>Possession Limit</u>	<u>Areas Open</u>
Merriam's Hunt #201 (early) April 30- May 11, 1994		Season Limit 1 Male Turkey 75 Permits		Boulder Mountain - Boundary begins at the junction of SR-62 and SR- 89 near Kingston, Utah; then southerly on SR-89 to the Pink Cliffs road between Glendale and Cannonville; then easterly on the Pink Cliffs Road to SR-12; then easterly and northeasterly on SR-12 to the Burr Trial road; then easterly on the Burr Trial road to the Capitol Reef National Park boundary; then northerly along the park boundary to SR-24; then westerly on SR-24 to SR-62; then southerly on SR-62 to SR-89.
Hunt #202 (late) May 14- May 31, 1994		Season Limit 1 Male Turkey 75 Permits		Boulder Mountain - Same as Hunt #201.
Hunt #203 * April 30- May 22, 1994		Season Limit 1 Male Turkey 35 Permits		Kolob - Area includes everything within the following description except for Zion National Park land; boundary begins at the junction of I-15 and SR-17; then easterly on SR-17 to SR-9 to the Zion National Park's east boundary; then northerly along the east boundary to the park's north boundary; then westerly along the park's north boundary to Deep Creek; then northerly on Deep Creek to Crystal Creek to the Cedar Mountain Road; then northerly on the Cedar Mountain road to I-15 then southerly on I-15 to SR- 17.
Hunt #204 (early) April 30- May 11, 1994		Season Limit 1 Male Turkey 75 Permits		Zion - Boundary begins at the junction of I-15 and SR-20; then southerly on I-15 to the Cedar Mountain Road; then southerly on the Cedar Mountain road to Crystal Creek; then southerly on Crystal Creek to Deep Creek; then southerly on Deep Creek to the Zion

## APPENDIX D (continued)
